Exercise 1: Connect the u-blox Device to Cumulocity

Objectives

In this exercise, you will get first hands-on experience of using the Internet of Things with Cumulocity and u-blox.

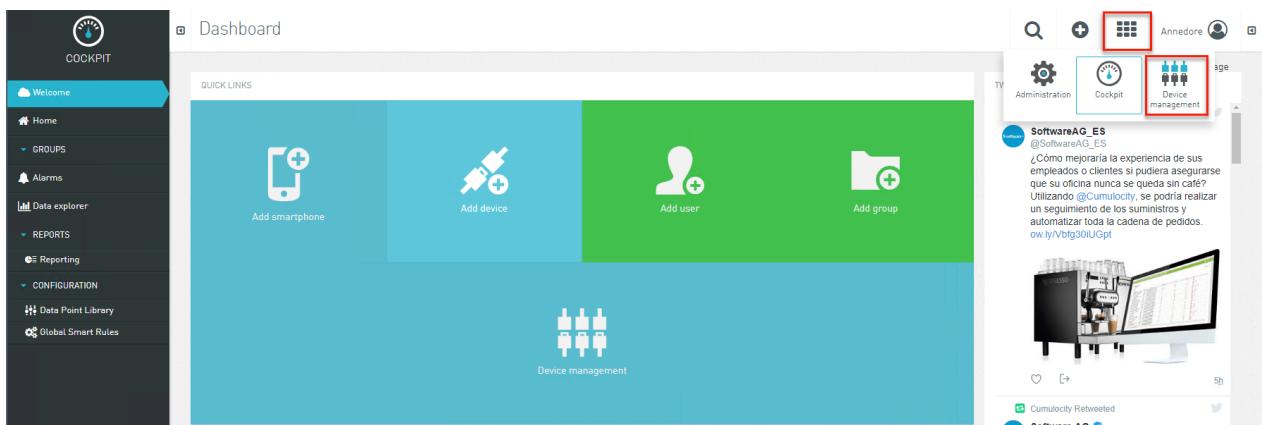

An assembled training hardware kit (**Mbed u-blox C027** with **mbed application shield**) with the **Cumulocity** software, an activated SIM card is a prerequisite for the training and provided by the training environment. You would also need good mobile network coverage. The kit provides the following sensor data:

- Temperature
- GPS
- Accelerometer
- Analog sensor

In case of questions you can refer to <https://cumulocity.com/guides/users-guide/overview/>.

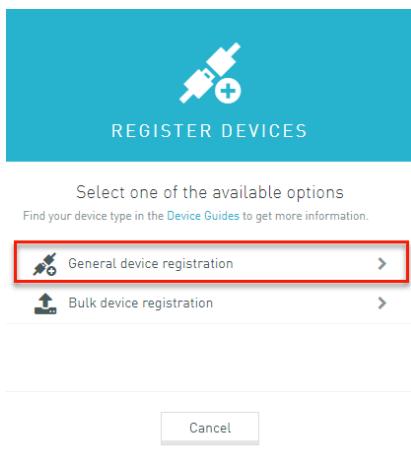

Steps

1. Get first hands-on experience of using the u-blox
 - a. An active SIM card is already assembled to the kit.
 - b. The Cumulocity Agent Software is already installed on the kit.
 - c. Attach the cellular antenna to the board.
 - d. For GPS/GNSS capabilities, attach the GPS antenna to the board
2. Connect the kit to a power source or use the USB connection and connect the kit directly with your notebook. The **Mbed u-blox C027** will now dial up to the Internet. On a successful login for the first time the display of the kit shows **Bootstrapping** and below the IMEI of the cellular modem on the LCD display. Please note the IMEI, you will need it for registration.
 - a. In case upon boot-up, the device displays **Connect to Cloud** right after **Agent Run**, instead of showing **Bootstrapping** and IMEI, your device is already registered with Cumulocity under another user account. A Factory Reset has to be performed to unregister the device. The factory reset removes the credentials so that the device can be re-registered again.
 - i. Press and hold the joystick when (re) starting an already registered device.
 - ii. Simply wait for **Factory Resetting** to appear on the screen. You can release your finger already. After about 2 seconds, you should see **Reset Success** on the display.
 - iii. Now restart the **Mbed u-blox C027** device.
3. Open your Chrome Browser and open <**Cumulocity tenant url**>. Verify that your browser shows the login prompt. Login to the **Cumulocity** account with the following properties:
 - a. **Cumulocity tenant url:** - as provided by the instructor –
 - b. **Username:** admin
 - c. **Password:** - as provided by the instructor –
4. Select the **Device management** application from the menu if not already open.

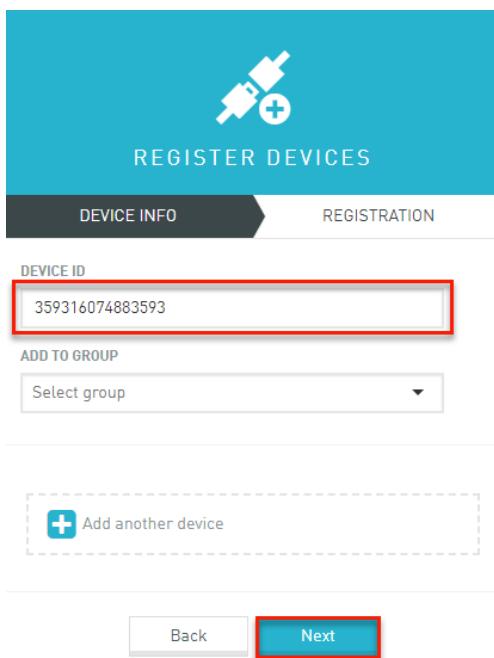

5. Open the **Device Management** menu and select **Devices > Registration**.

6. Click **Register Device** and select **General device registration**.

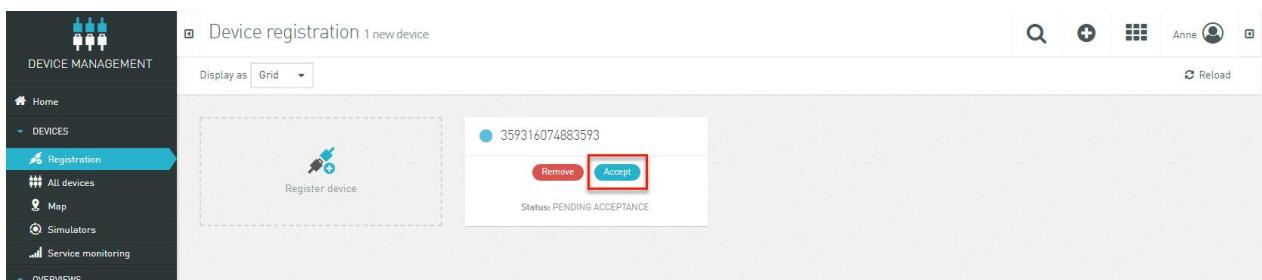

7. Enter the IMEI as shown in the LCD display after successful connection - refer to Step 2. Click **Next**.

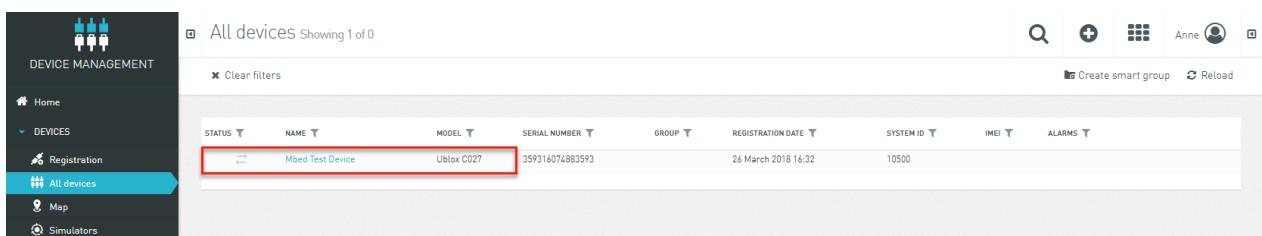

Note: The IMEI can also be found on the white sticker on modem chip of the C027.

8. Click **Finish**. Turn on the device. After a while the device appears as status **Pending Acceptance**. Click the **Accept** button

9. The device is now registered with Cumulocity. Navigate to **Devices > All devices**. In case you don't see your device click **Clear filters**. The new connected device shows up with the name **Mbed Test Device**.

10. After the device is successful connected to the Cumulocity platform, it will update the LCD display regarding its current status. The first line always displays the tenant name (until there is a message received from the platform). The second line shows the signal quality in units of dBm. The third line displays information about which sensor data the u-blox is sending and their corresponding values. In case similar sensory values are read comparing with the last sending, the third line is empty implying a skip of sending.

11. In order to distinguish your device from the other devices select the device from the list.

Exercise 1: Connect the u-blox Device to Cumulocity

The screenshot shows the Cumulocity Device Management interface. On the left, a sidebar lists various management options like Home, Devices, Registration, and Groups. The 'All devices' option is selected. The main panel displays the 'Mbed Test Device' details. The 'Info' tab is active, showing the device's name ('Mbed Test Device'), type ('com_ublox_C027_REV-A'), ID ('10500'), owner ('device_359316074883593'), and last updated ('2018-03-26T14:33:04.223Z'). The 'DEVICE AND COMMUNICATION' section shows signal strength over time and recent events like 'cBy_UnavailabilityAlarm' and 'cBy_LocationUpdate'. The 'ACTIVE, CRITICAL ALARMS' section shows 'No alarms to display'. The 'GROUP ASSIGNMENT' section indicates 'Device not assigned'.

- 12.** In order to change the name of the device navigate to **Info > Device Data**. Switch over to **Edit mode**. Change the name of the device by using your Software AG userid as a prefix.

a. **Name:** <softwareag-userid> Mbed Test Device

This screenshot shows the 'Info' tab of the 'Mbed Test Device' configuration page. The 'NAME' field has been changed to 'API Mbed Test Device'. The 'Save' button at the bottom of the form is highlighted with a red box. The rest of the interface is identical to the previous screenshot, including the sidebar and other tabs.

Click Save.

- 13.** Use the Search functionality to just show your device in the list of devices.

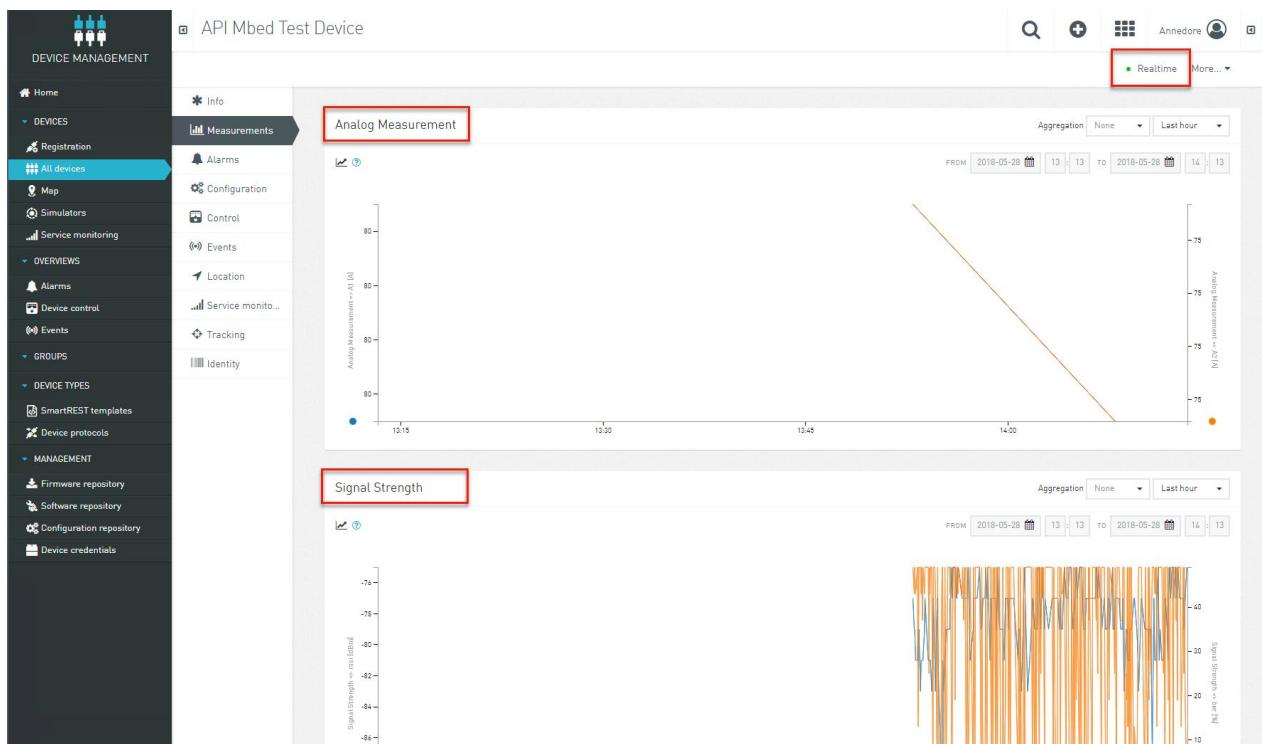

This screenshot shows the 'Info' tab of the 'Mbed Test Device' configuration page. The 'API' tab is now selected. Two search icons are highlighted with red boxes: one in the top right corner of the header and another in the bottom right corner of the main content area. The rest of the interface is identical to the previous screenshots.

- 14.** Select your device from the list. Move your device up and down, left to right. Select **Measurements** form the menu bar on the left hand side. The list of measurements covers a set of available sensor data. This might be:

a. Analog Measurement

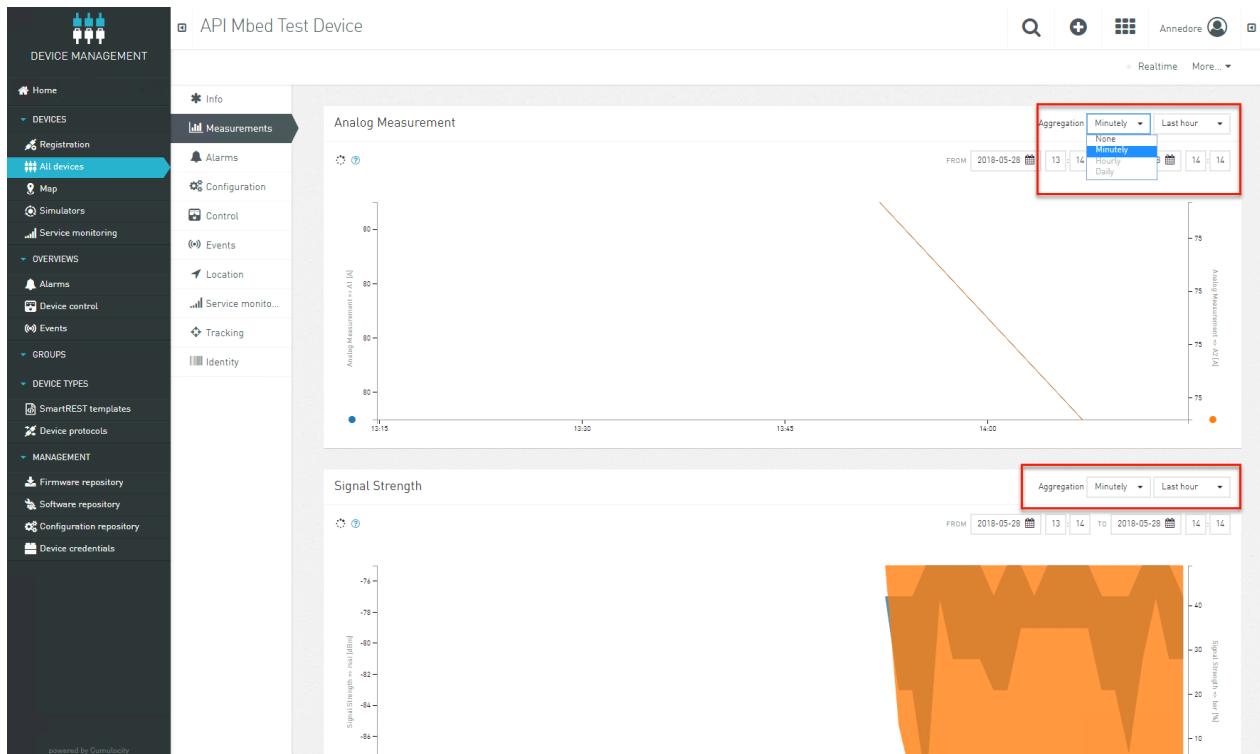

b. Signal Strength

In case not already selected switch to **Realtime**.

- 15.** Use the different filter criterias to customize the default display

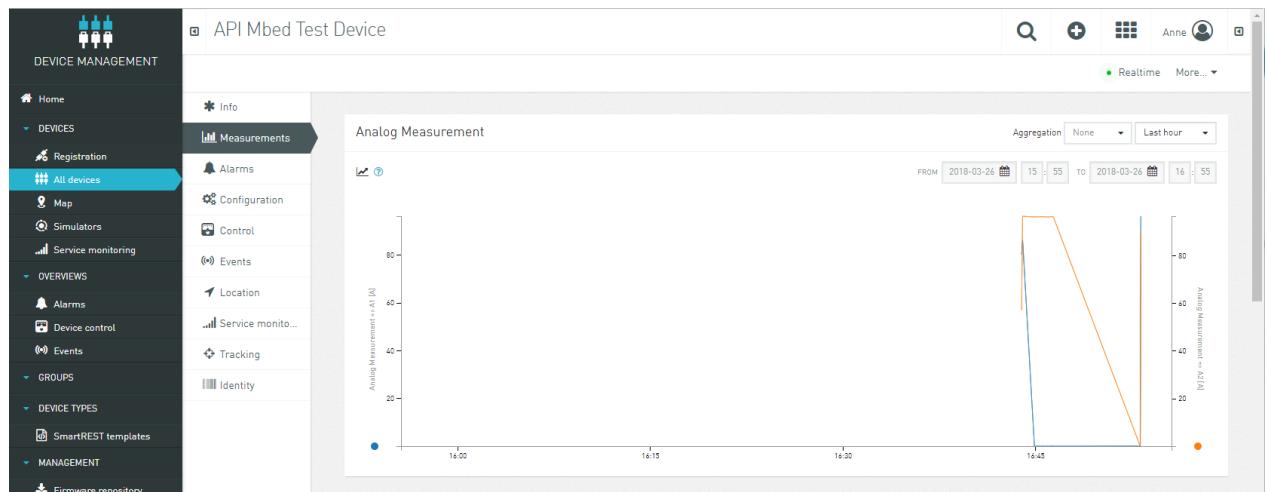

a. modify the timeline interval of the graph to last hour

- b. Modify the start-date for the timeline by moving the start to a date in the past. Click the date-value a calendar will show up.

16. Turn the 2 accelerator wheels, turn the left accelerator to the very right limit and turn the right accelerator to the very left limit. Refresh the screen, this will now show an additional graph **Analog Measurement**. This is shown in the graph with one line at the top of the y-axis and the other line at the bottom of the y-axis.

Note:

- a. In case of display showing **Network: no coverage** make sure that you have a **good mobile network coverage**.

Exercise 2:

Connect your Smartphone (Android) to Cumulocity

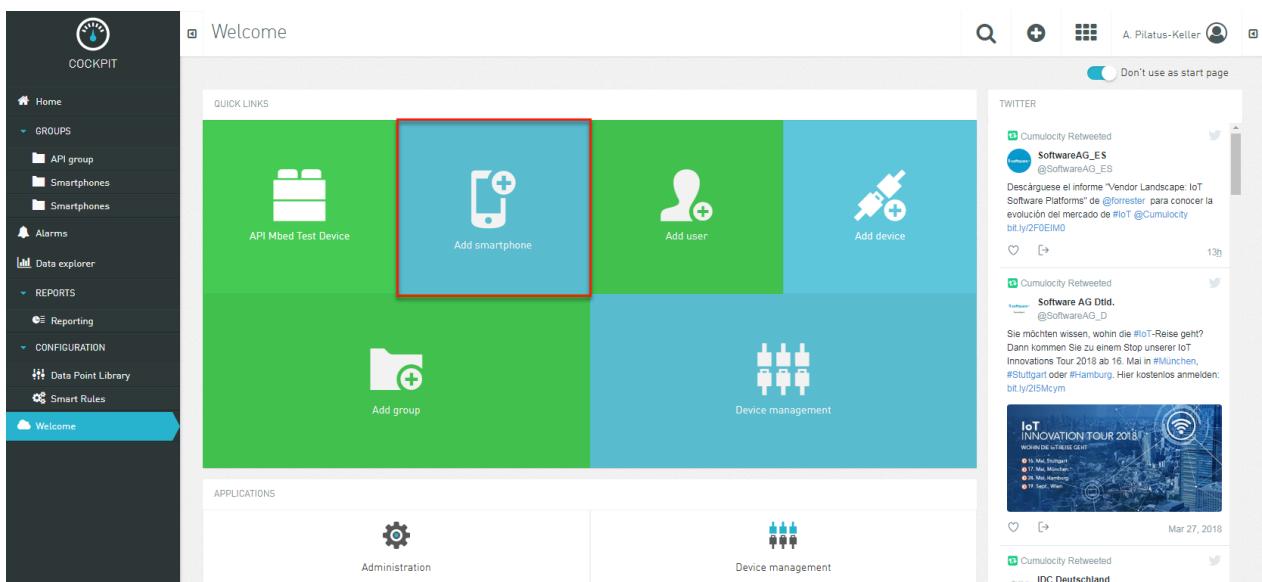

Objectives

In this exercise, you will get first hands-on experience of using the Internet of Things with Cumulocity and Android.

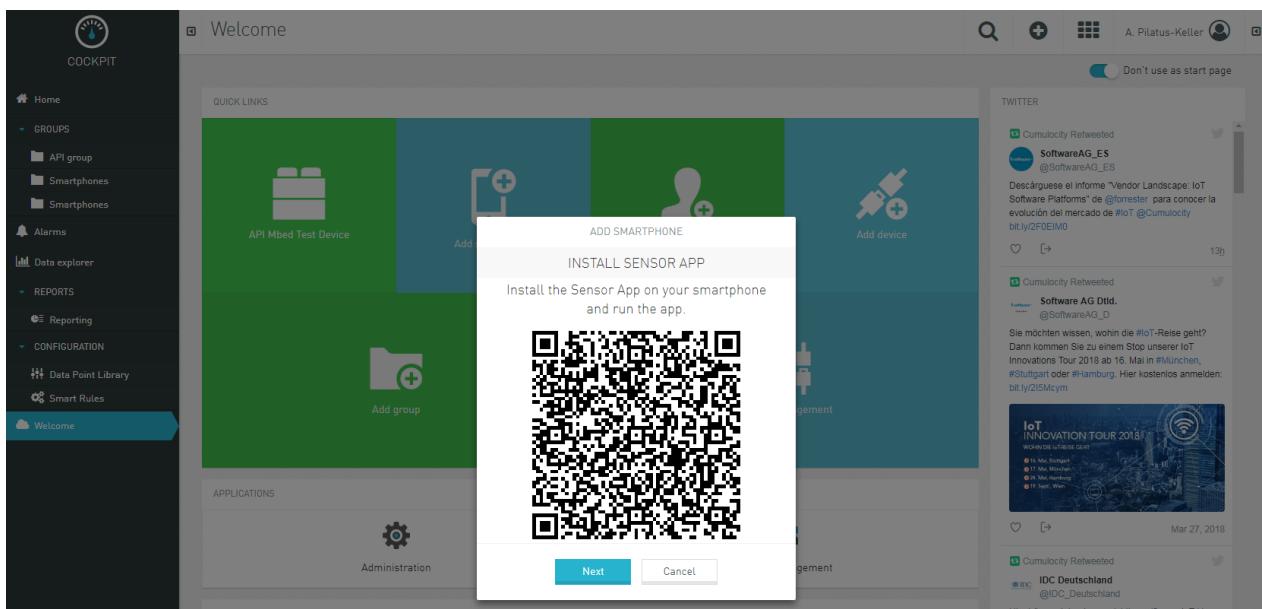

Note: This only works with Android 5.

Steps

1. Login to **Cumulocity** account. Open the URL <Cumulocity tenant url>
 - a. **Cumulocity tenant url:** - as provided by the instructor –
 - b. **Username:** admin
 - c. **Password:** - as provided by the instructor –
2. Navigate to the **Cockpit** application. Navigate to the **Welcome** page. Click the **Add smartphone** button under QuickLinks. This will open a wizard.

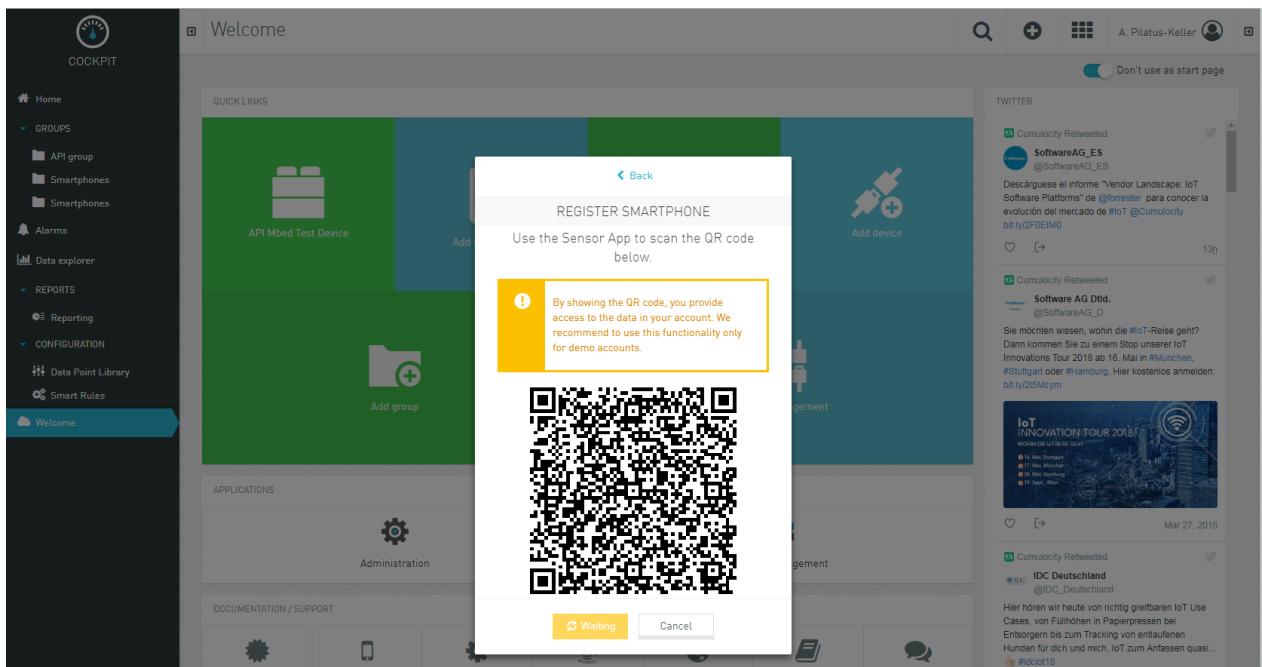

3. If you have a QR code scanner on your mobile phone, scan QR code. You will be navigated to Google Play for installing the Cloud Sensor App.

You can also start **Google Play** manually.

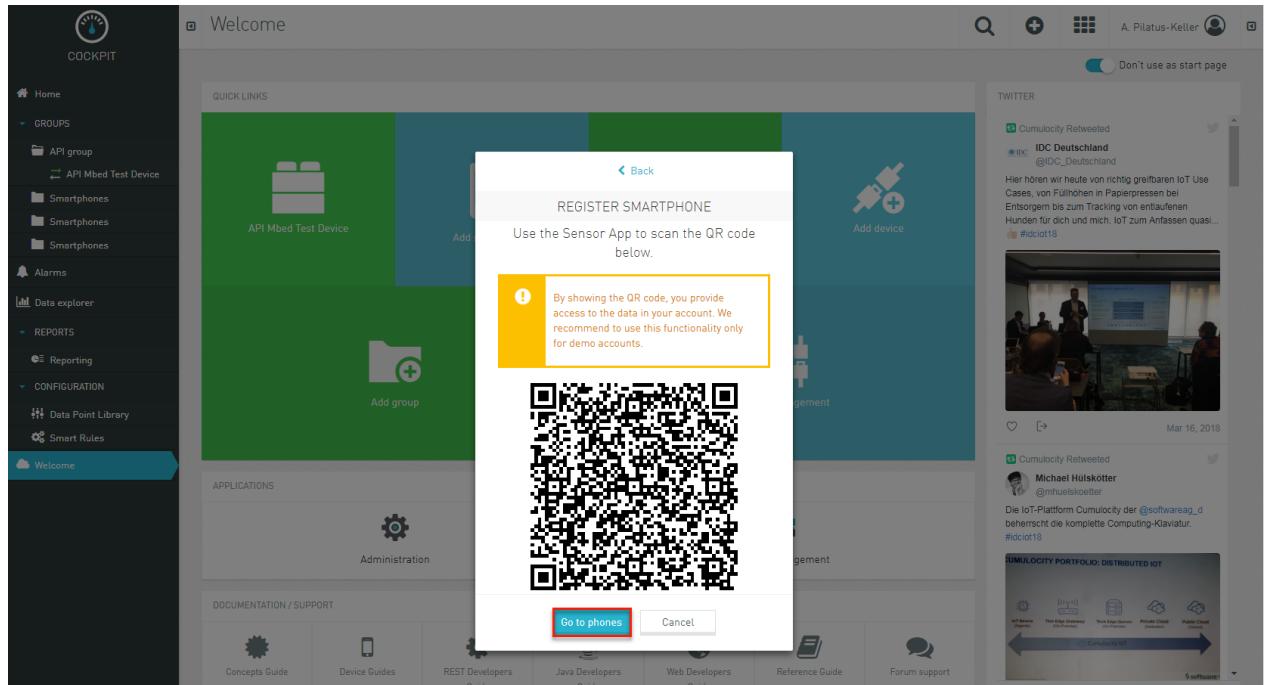

- Search for **Cumulocity** and install the **Cloud Sensor App** listed in the results.
4. Click **Next** in the **Cockpit** wizard to see the QR code with credentials to register the Cloud Sensor App to your tenant. The registration credentials are encrypted however, it is recommend to use this only for demo purposes.

- Open the Cloud Sensor App on your smartphone and click the **QR code Scannen** symbol on the top. Then scan the second QR code.
- Note: On Android 6 or later, the app will request for permission to access your device location and camera.
- As soon as the smartphone has scanned the registration credentials QR code, it is added to the automatically created group **Smartphones**.
- Once your Cloud Sensor app is registered, the next screen will indicate the device name that will be used to identify your smartphone at the platform. The permission requests for accessing the network

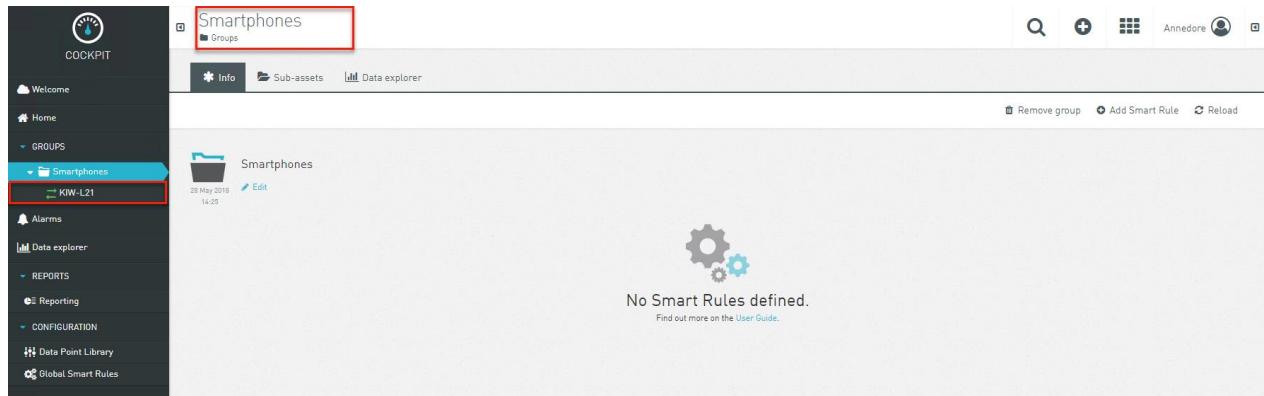

information, accessing GPS data and storing location map images cache will be prompted only once on start. Please accept them so that the smartphone can transfer network and GPS data to the cloud.

8. Within your Cockpit application you can navigate to the **Smartphones** group in Cockpit by clicking **Go to phones**.

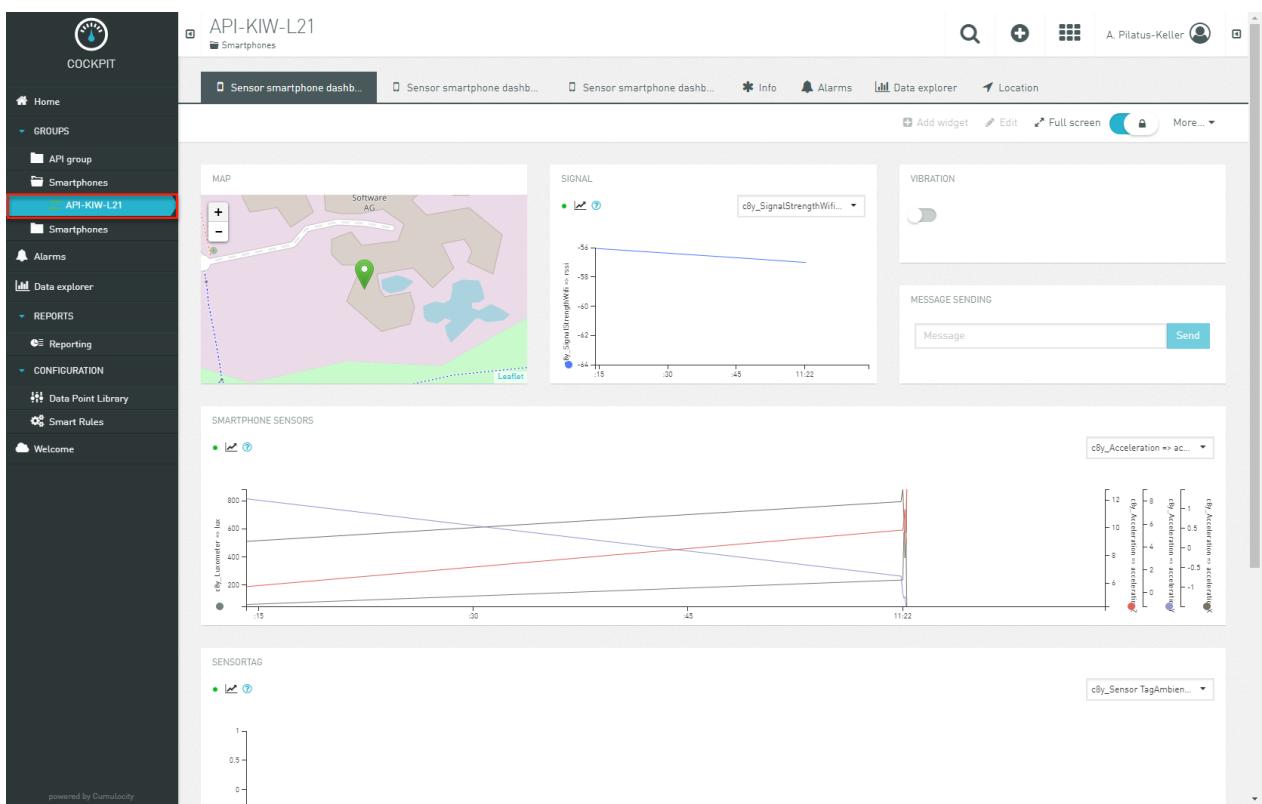

Click on **Go to phone** in the wizard.

9. Your smartphone is listed in the group.

10. Navigate to **Device Management** application and change the name of your smartphone by adding your <softwareag userid> as prefix.
11. Switch back to **Cockpit** application. Select your smartphone and open the sensor smartphone dashboard.

12. Experiment with the phone and see how the visualization on the dashboard changes.

- Send a message to your smartphone.
- Rotate your smartphone and view the rotation in the **Rotation widget**.

13. Take your smartphone with you for the coffee break and check the track.

Exercise 3:

Create a User in Cumulocity

Objectives

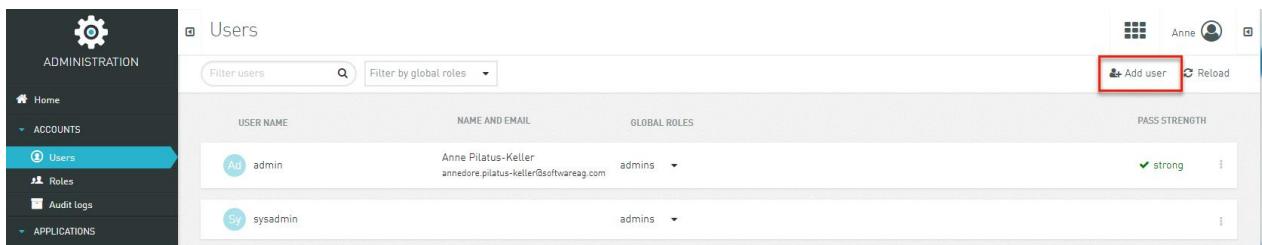

In this exercise you create a user for yourself to not disturb the other users during experimenting and to test concepts related to ownership, permissions, auditing ...

Steps

1. Make sure that your device is installed, running and connected to the Cumulocity platform. If this is not the case please refer to Exercise 1.
2. Login to **Cumulocity** account. Open the URL <**Cumulocity tenant url**>
 - a. **Cumulocity tenant url:** - as provided by the instructor –
 - b. **Username:** admin
 - c. **Password:** - as provided by the instructor –
3. Navigate to **Administration** application by clicking on the application switcher (grid icon on the top right) and selecting **Administration**.

4. Navigate to **Users**. Click **Add user**.

5. Fill in at least the following properties:

- a. **Username:**
- b. **E-mail:**
- c. **Firstname:**
- d. **Lastname:**

In case the checkbox **Send password reset link as e-mail** is ticked, please untick and provide

- e. **Password:**
- f. **Confirm password:**

6. Select the **admins** and **business** checkbox in the **Global roles** section.

The screenshot shows the Cumulocity Administration interface under the 'ACCOUNTS' section. On the left, a sidebar lists various management categories like 'Users', 'Roles', 'Audit logs', etc. The 'Users' item is currently selected and highlighted with a blue arrow. The main panel displays a form for creating a new user named 'api'. The 'Identification' tab is active, showing fields for 'USERNAME (E.D. E-MAIL)' (set to 'api'), 'ACTIVE' status (set to 'Enabled'), 'FIRST NAME' ('Anne'), 'LAST NAME' ('Pilatus-Keller'), 'TELEPHONE' (empty), and 'LOGIN OPTIONS' (checkboxes for 'User must reset password on next login' and 'Send password reset link as e-mail'). Below these are 'Global roles' checkboxes: 'business' (selected) and 'admins' (selected). A red box highlights both the 'business' and 'admins' checkboxes. At the bottom right of the form are 'Cancel' and 'Save' buttons.

Click **Save** at the bottom of the page.

7. Click the small **User** icon on the top right and select **Logout** to go back to the **Login** page.

The screenshot shows the Cumulocity Administration interface under the 'ACCOUNTS' section. The 'Users' item is selected. The main panel displays a table of users. The first user, 'admin', has 'NAME AND EMAIL' (Anne Pilatus-Keller, annedore.pilatus-keller@softwareag.com) and 'GLOBAL ROLES' (admins). The second user, 'api', has 'NAME AND EMAIL' (Anne Pilatus-Keller, anne.pilatus-keller@softwareag.com) and 'GLOBAL ROLES' (admins, business). The third user, 'sysadmin', has 'NAME AND EMAIL' (empty) and 'GLOBAL ROLES' (admins). In the top right corner, there is a user menu with options like 'User settings', 'Access denied requests', and 'Logout'. The 'Logout' option is highlighted with a red box.

8. Log in as your new user. You may want to select **Remember me**.
9. Navigate to the **Device Management** Application. Navigate to **All devices** and experiment with sorting and filtering. Examples:
 - Sort the list of devices by registration date
 - Filter all **Ublox C027**
 - Create a **smart group** with all **Ublox devices C027**.

The screenshot shows the Cumulocity Device Management interface under the 'DEVICES' section. The 'All devices' item is selected. The main panel displays a table of devices. The first device listed is 'API Mbed Test Device' (Model: Ublox C027, Serial Number: 359316074883593, Registration Date: 26 March 2018 16:32, System ID: 10500, IMEI: 359316074883593). In the top right corner, there are several buttons: a search icon, a plus sign for adding a new device, a grid icon, and a user icon. Next to the user icon is a 'Create smart group' button, which is highlighted with a red box.

Exercise 3:
Create a User in Cumulocity

The screenshot shows the Cumulocity Device Management interface. On the left, a sidebar menu is open under 'DEVICE MANAGEMENT'. The 'GROUPS' section is expanded, and 'Annes Smart Group' is selected, indicated by a blue arrow pointing to it. The main content area displays the details for 'Annes Smart Group'. It includes a megaphone icon with the message 'No notes yet!' and an 'Edit' link. Below this is a section titled 'GROUP DATA' with a table showing 'NAME' and 'Annes Smart Group'. To the right is a section titled 'ACTIVE, CRITICAL ALARMS' with a bell icon and the message 'No alarms to display.' A small 'Edit' link is located at the bottom left of the main content area.

This page intentionally left blank

Exercise 4: Create your own Dashboard

Objectives

In this exercise, you will understand how Cumulocity decouples devices and asset hierarchies. You will create your own dashboard.

Steps

1. Make sure that your device is installed, running and connected to the Cumulocity platform. If this is not the case please refer to Exercise 1.
2. Login to **Cumulocity** account. Open the URL <Cumulocity tenant url>

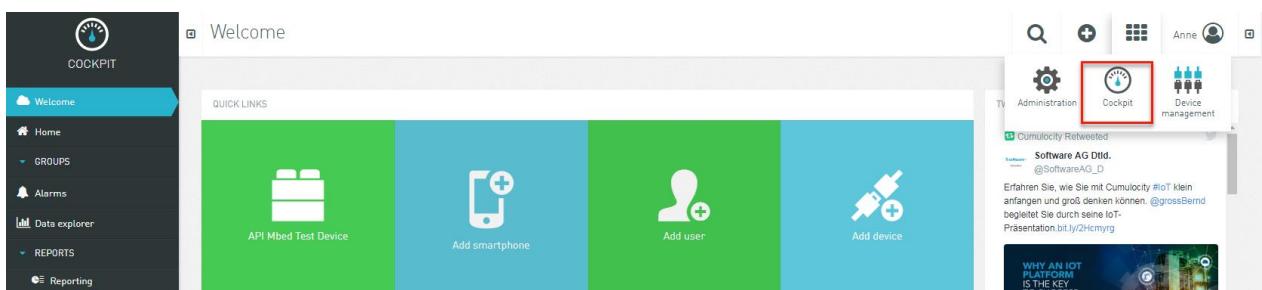

<Cumulocity tenant url> as provided by the instructor

Log in with the following credentials:

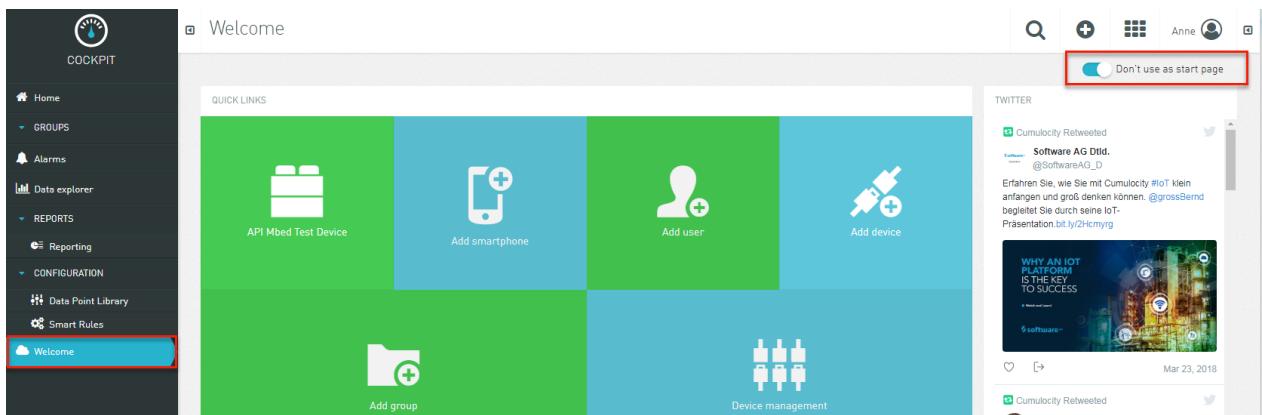

Username: - as defined in exercise 3 step 5 –

Password: - as provided in exercise 3 step 5 –

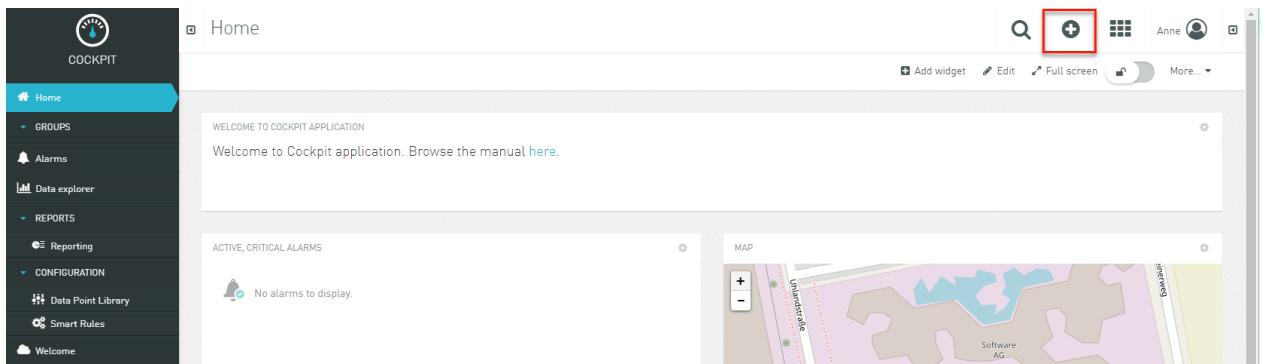

3. Open the **Cockpit** application through **Application Switcher**, the grid icon on the top right of the user interface

4. You can use the **Don't use as start page** slide to change the start from the **Welcome** page to the **Home** page.

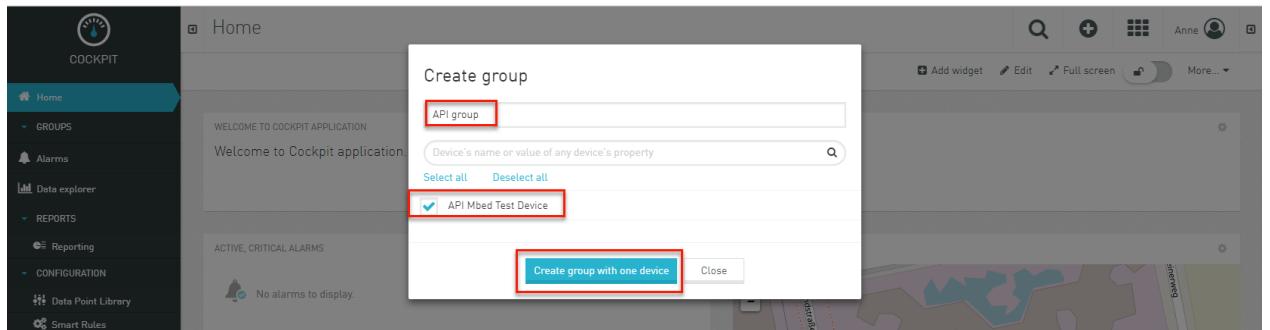

5. Click the + button at the top and select **New group** to add a new group.

Provide the following properties:

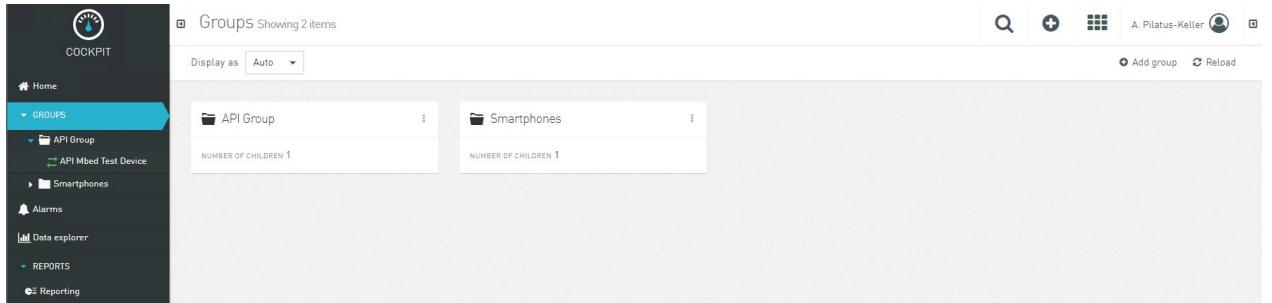

- a. **New group name:** <your userid> group

Select some of the training kits in the list. If needed click **Search more** to expand the list.

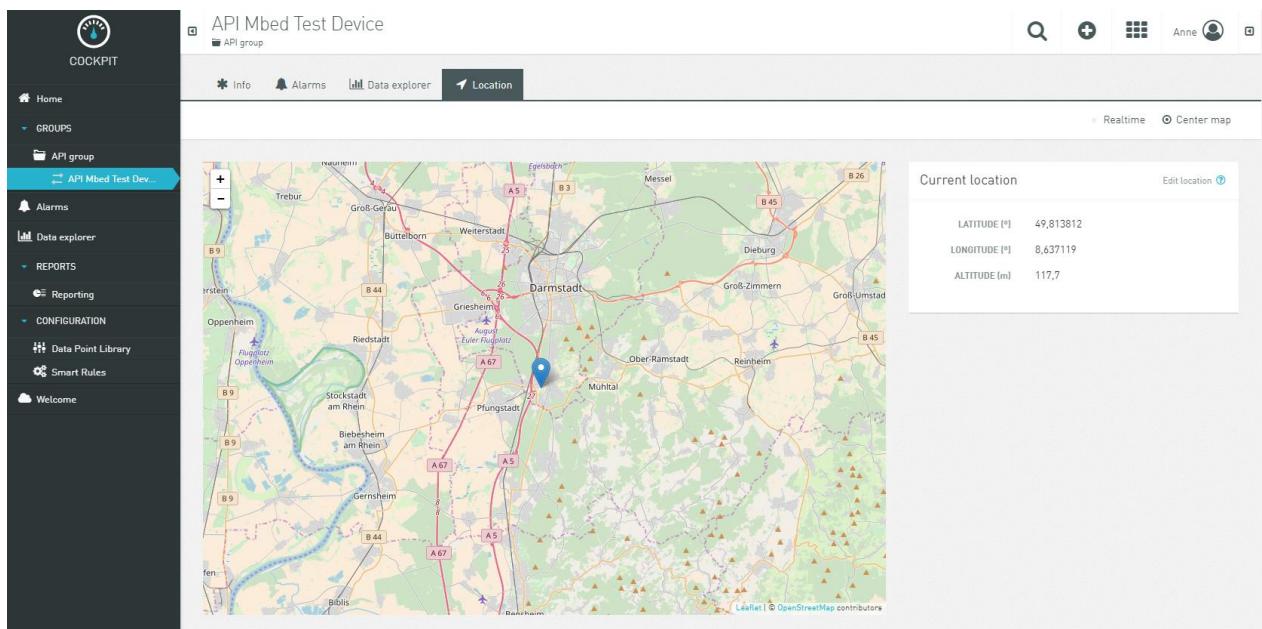

Click Create Group With .. Device.

6. Click on the new created asset in the navigation tree **Groups**.

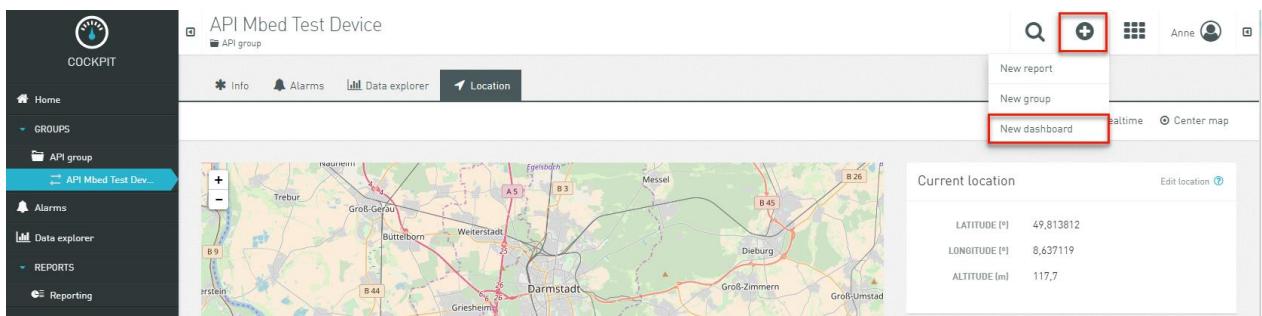

7. Select the previously created group. Select **Sub-assets** tab. Select you device from the list. Select the tab **Location**.

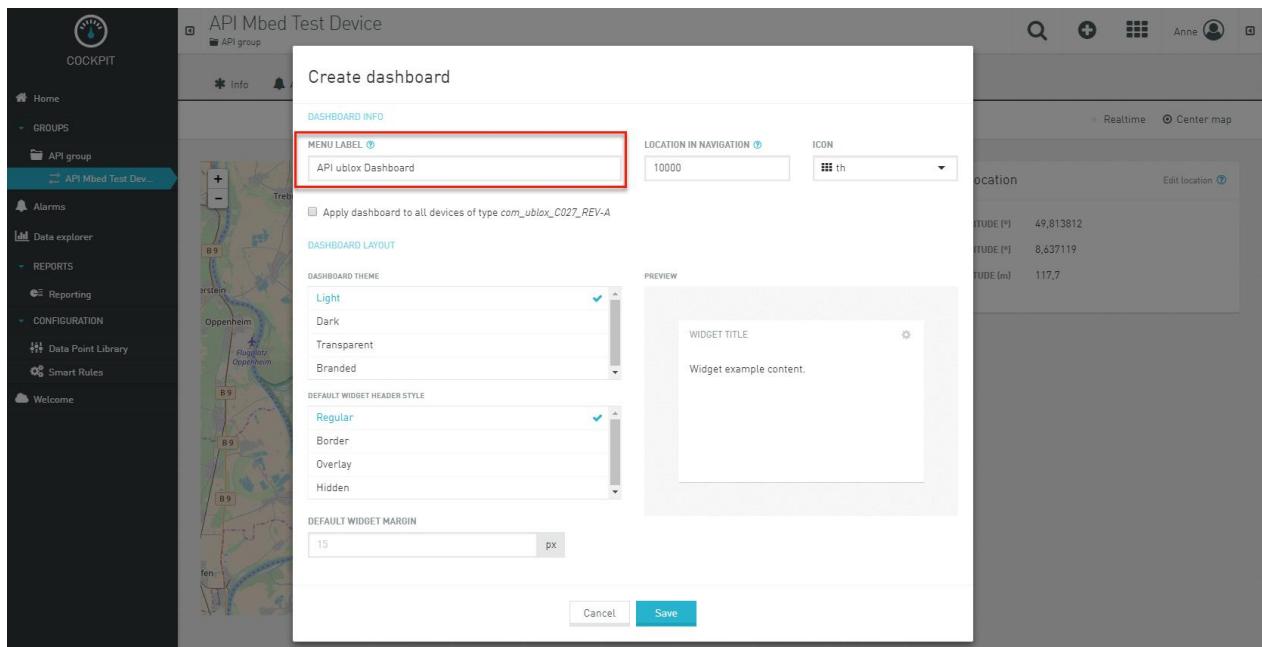

- a. This is a shortcut to the default **Location** widget.

- Create a dashboard by clicking the + in the header. Click **New Dashboard**.

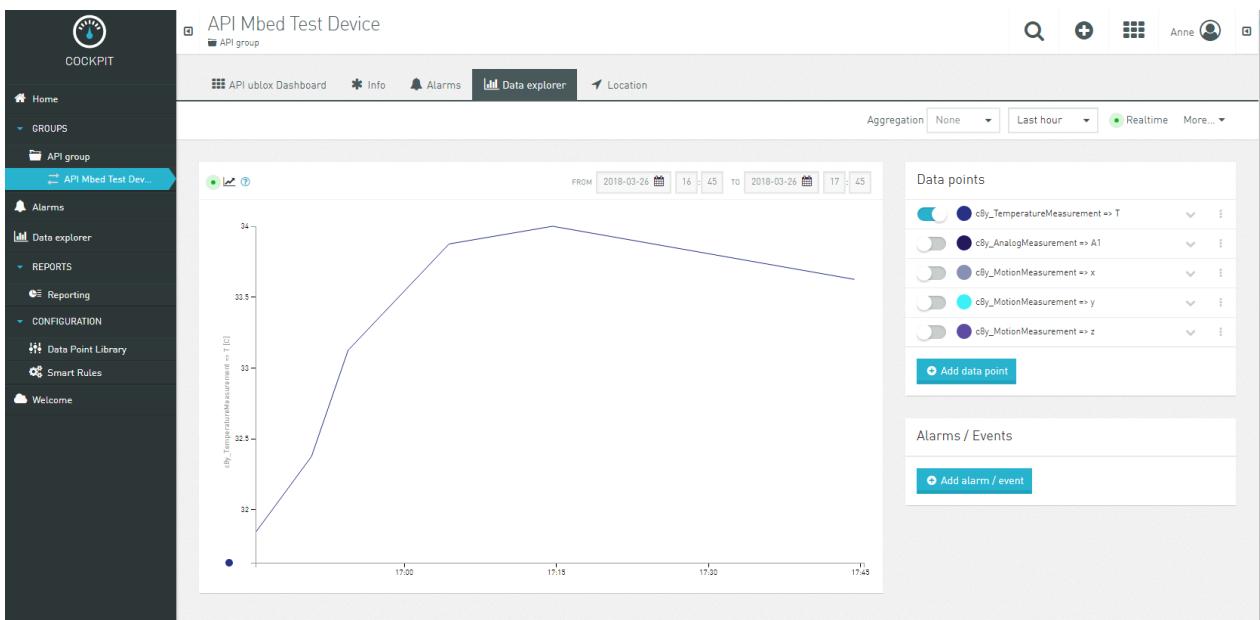

- Menu Label:** <your userid> ublox Dashboard

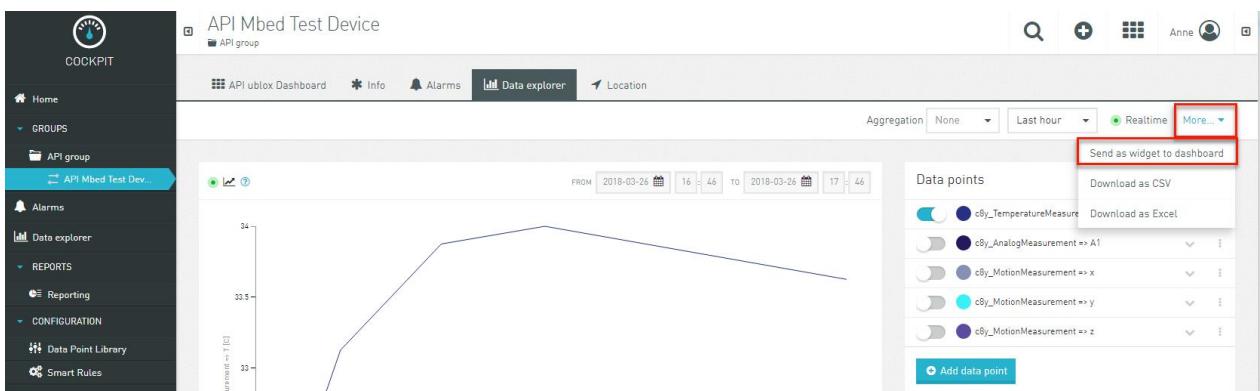

Keep all defaults. Click **Save**.

- Send the **Data Explorer** widget to the dashboard. Select the tab **Data Explorer**.

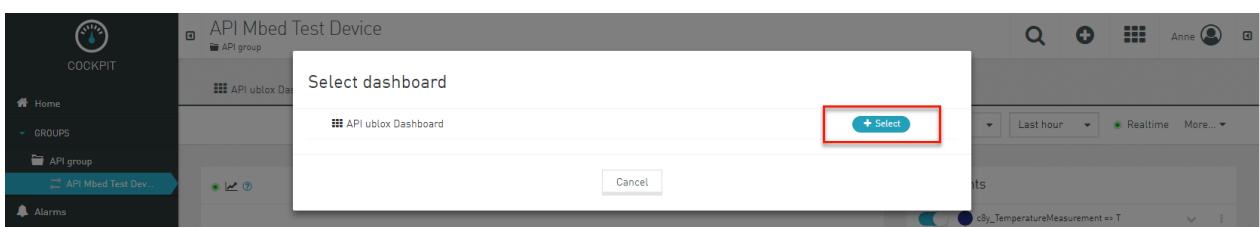

- This is a shortcut to the default data explorer information to the selected device.

- b. Click **More ...** in the upper right corner to open the drop down menu. Click **Send as widget to dashboard**.

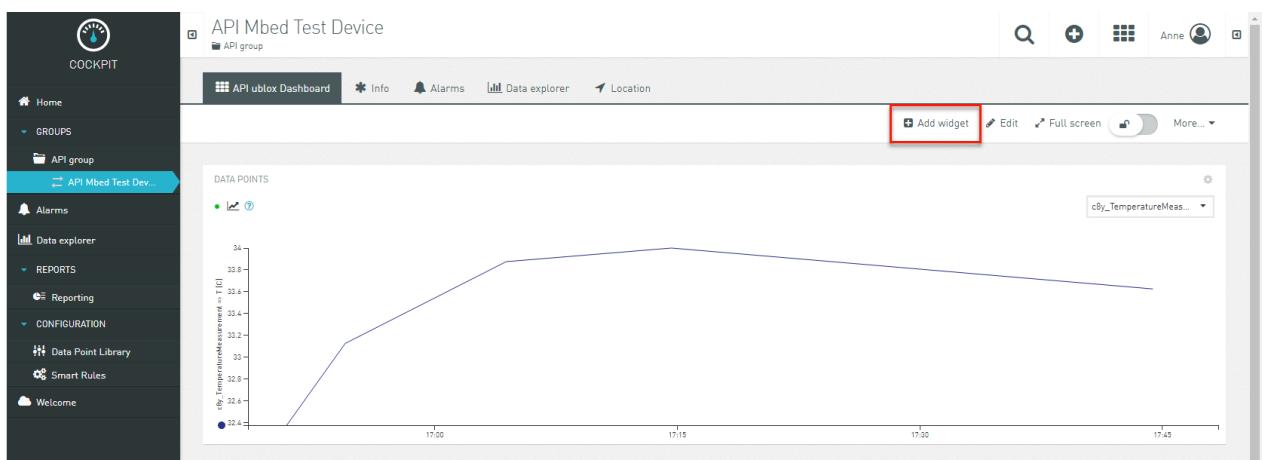

On the **Select Dashboard** dialog 'select the new created dashboard.

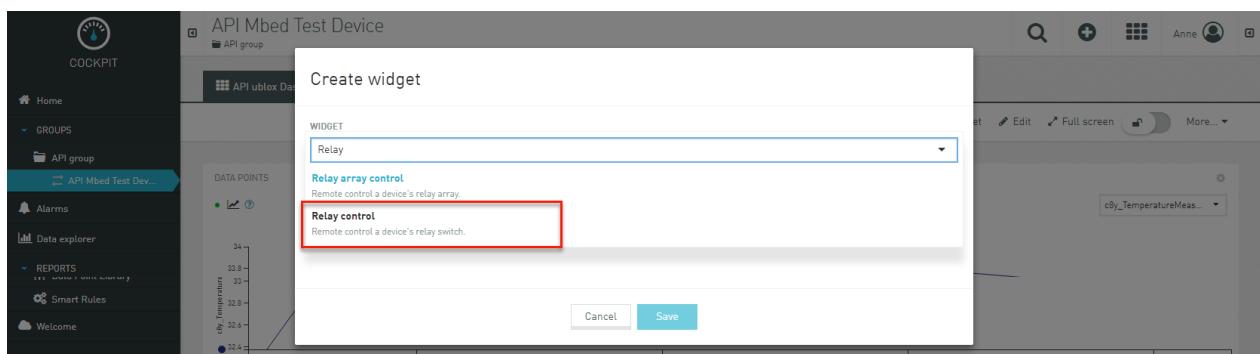

Click **+Select**.

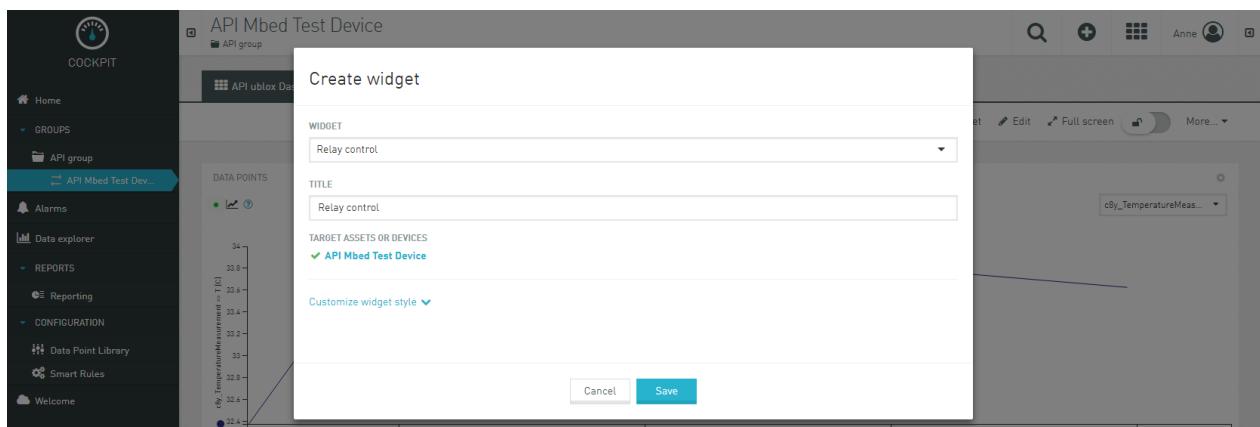

10. Select the tab with the name of your new created dashboard. Add some widgets to the dashboards.
Click the **Add widget** button.

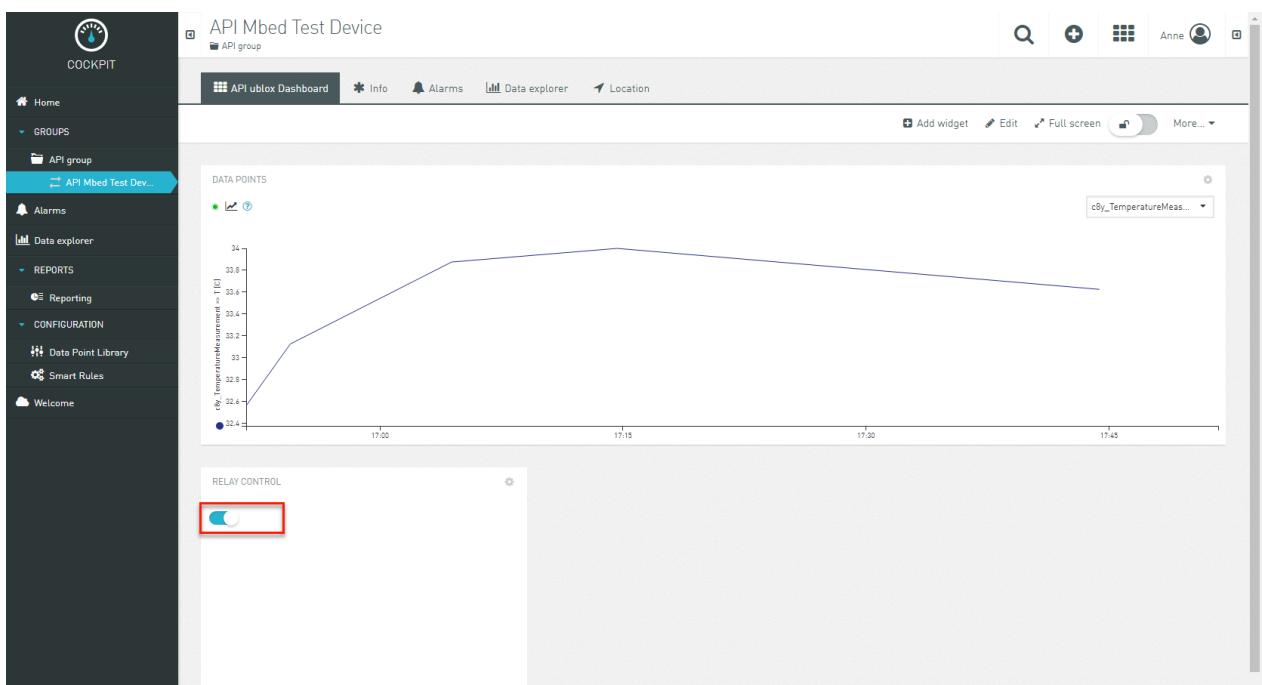

a. Search for Relay and select **Relay Control**

Keep the defaults and click **Save**.

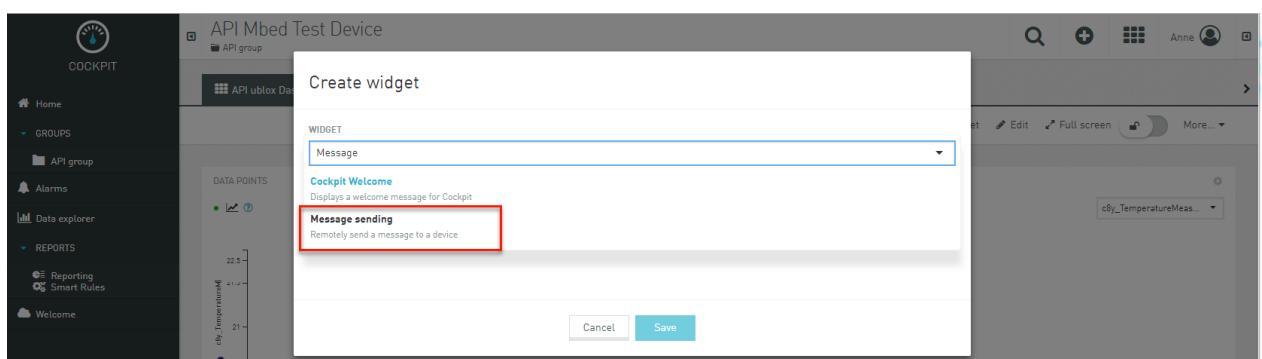

11. Use the **Relay Control**. The little green light on the **Ublox** device will show up.

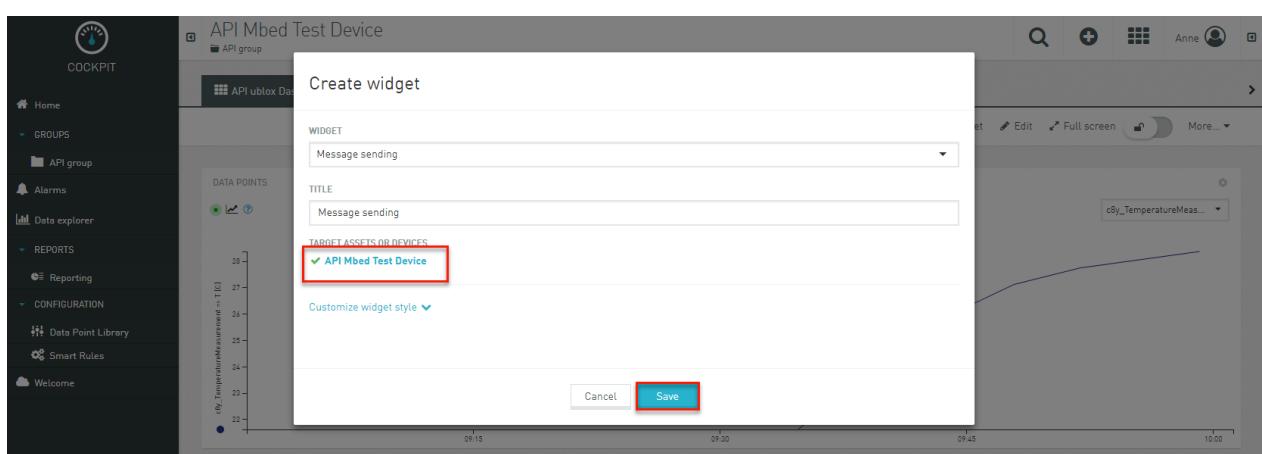

12. Add another widget to the dashboard.

a. Search for **Message** and select **Message sending**

b. Select your device, keep the defaults and click **Save**.

c. Use the widget to send a message to your device. You will see the message of the display of your ublox device.

13. Add the widget **Info Gauge to the dashboard.**

a. On the configuration page **Data point for gauge** select

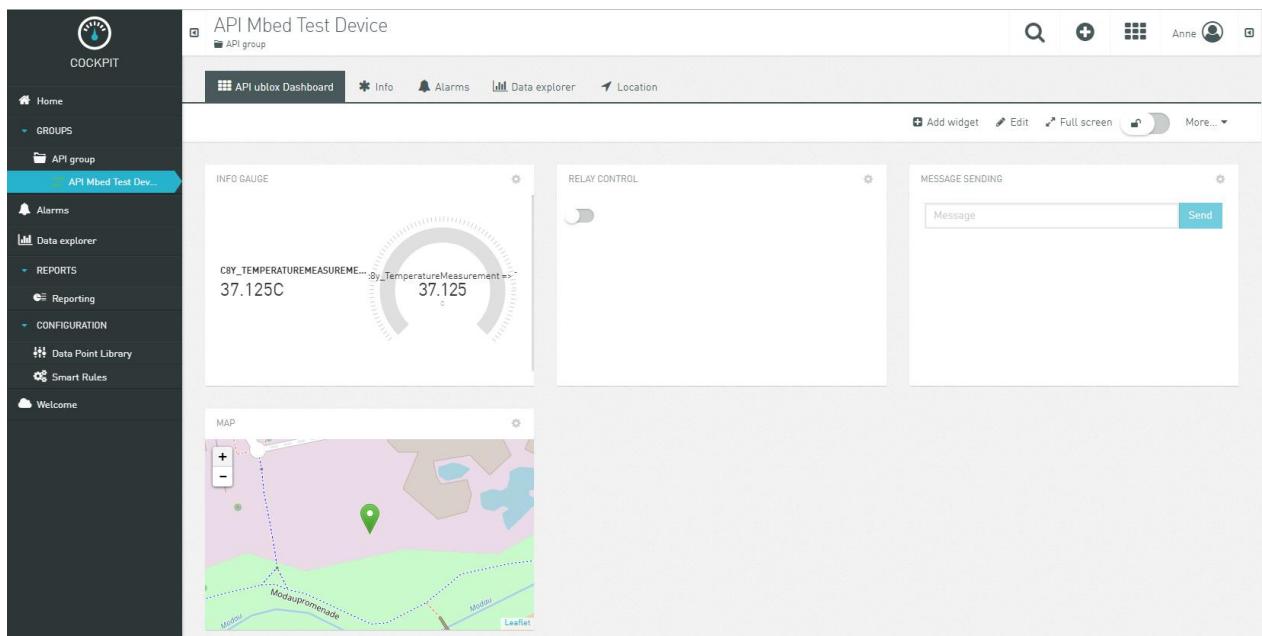

- c8y_TemperatureMeasurement**
- On the Configuration for Data point for labels select
 - c8y_TemperatureMeasurement**

Click **Save**.

14. Drag and drop the widgets in the dashboard.

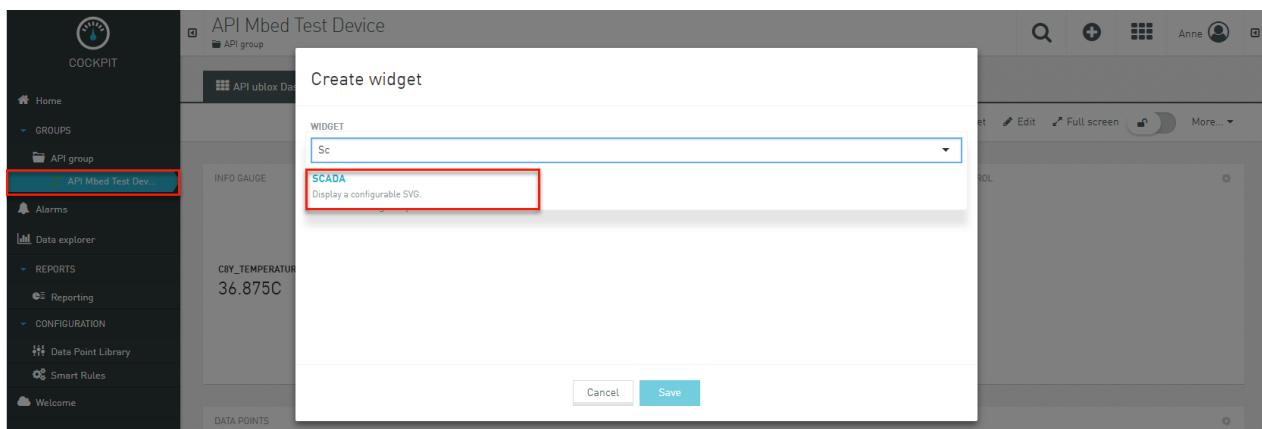

15. Add the widget **Map** to the dashboard.

a. Keep the defaults. Click **Save**.

16. Add a Pie Chart widget and configure the parameters to show the 3 motion measurement values.

17. Add a **SCADA** Widget to your device dashboard. A **SCADA** widget is a dashboard with animation. Select your device dashboard. Click the **Add widget** button to add a widget. Search for **SCADA**

a. Provide the following properties:

- Title:** <your userid> Scada
- Browse to the location **C:\Training\231-70E\Exercise4** where you find the file **windmill.svg**.
- Configure the 5 placeholders. You need to choose a device and map device information. Hover the mouse over one of the placeholders. You will find the edit icon on the right hand side of the placeholder section. Click the edit icon.

Create widget

Customize widget style ▾

Click Save.

- Move the widget wherever you want.

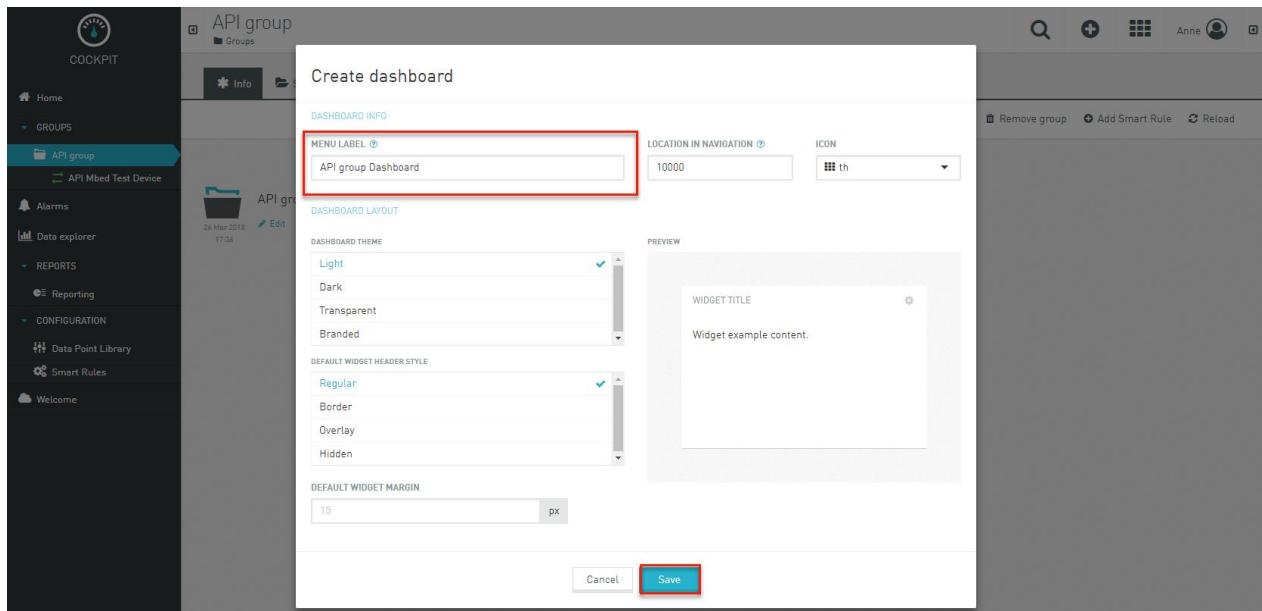

18. Now we want to create a group dashboard. Navigate back to the new created group and click the + icon in the header at the top right. Select **New dashboard** to add a group dashboard.

Provide the following properties:

Name: <your group name> Dashboard

Keep all defaults. Click **Save**.

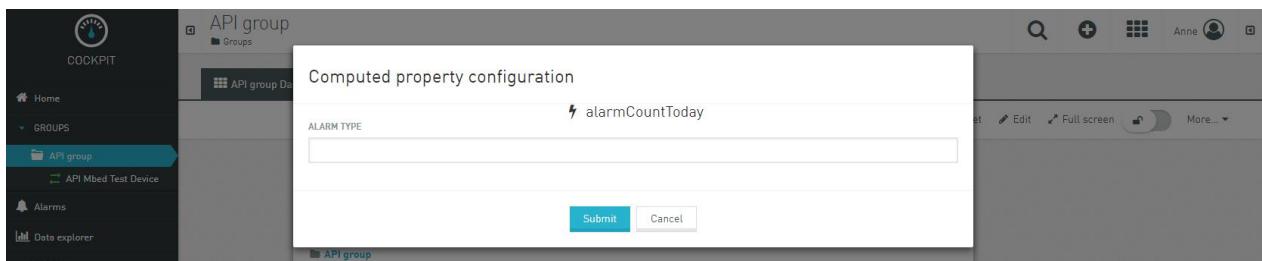

19. Click the tab representing the new created group dashboard .

Click the **Add widget** button to add a widget **Asset Table** with some columns. On the widget configuration page provide the following properties

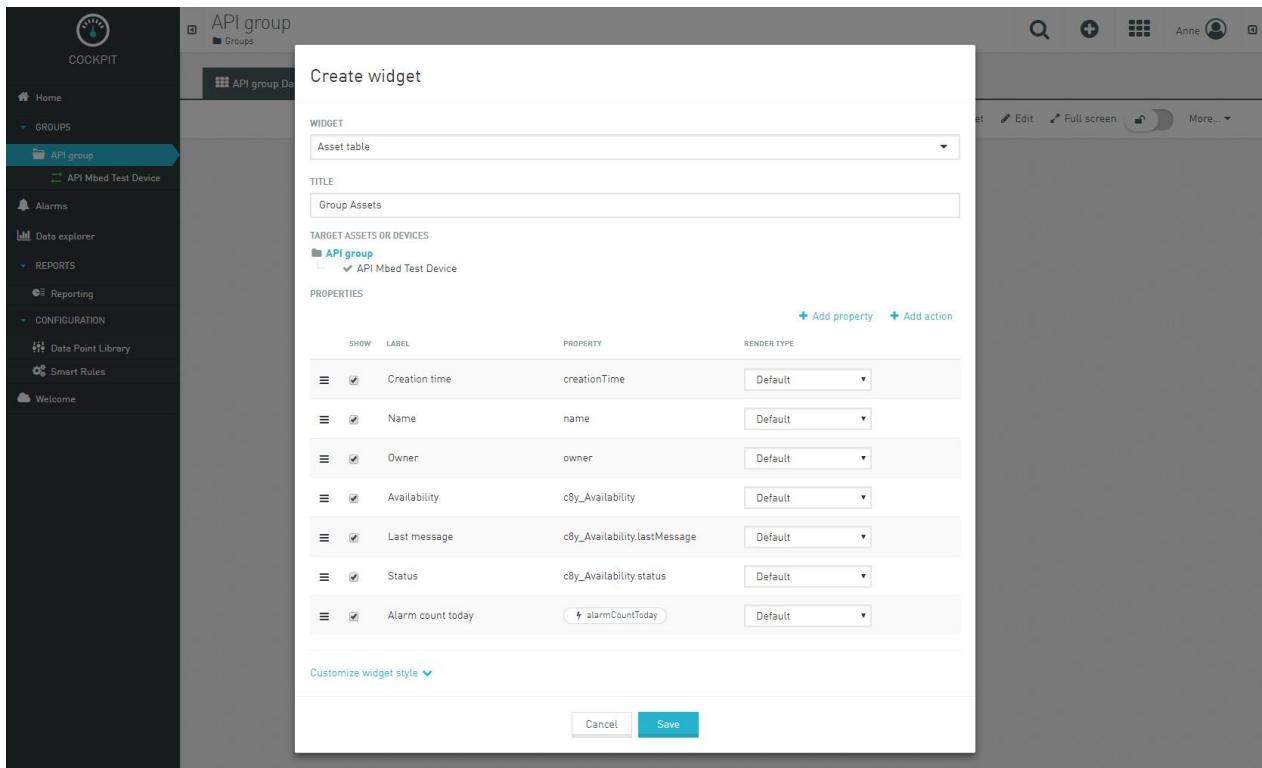

- Widget:** Asset table (predefined)
- Title:** Group Assets
- Properties**
 - Click **Add property** and select (scroll down to find all properties)
 - Creation time:**
 - Name:**
 - Owner:**
 - Availability:**
 - Last message:**
 - Status:**
 - Alarm count today:**

Click **Select** on the **Select properties** dialog.

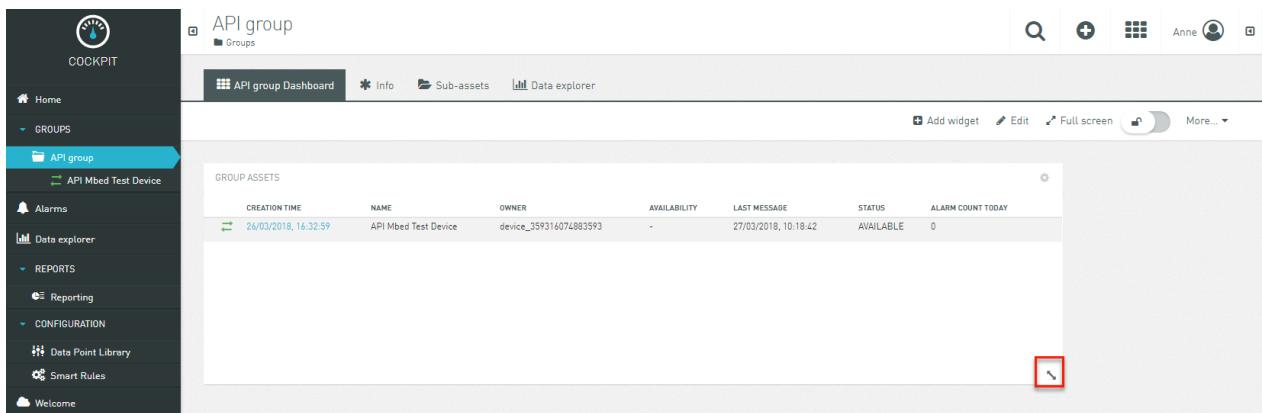

Ignore the request for the alarm type. Click **Submit**.

Click **Save**.

d. Within the widget use the arrow in the right hand bottom corner to enlarge the table

Within the widget use the arrow in the right hand bottom corner to enlarge the table

20. Click **Add widget** to add **Data points graph** widget to the group dashboard. Provide the following properties:

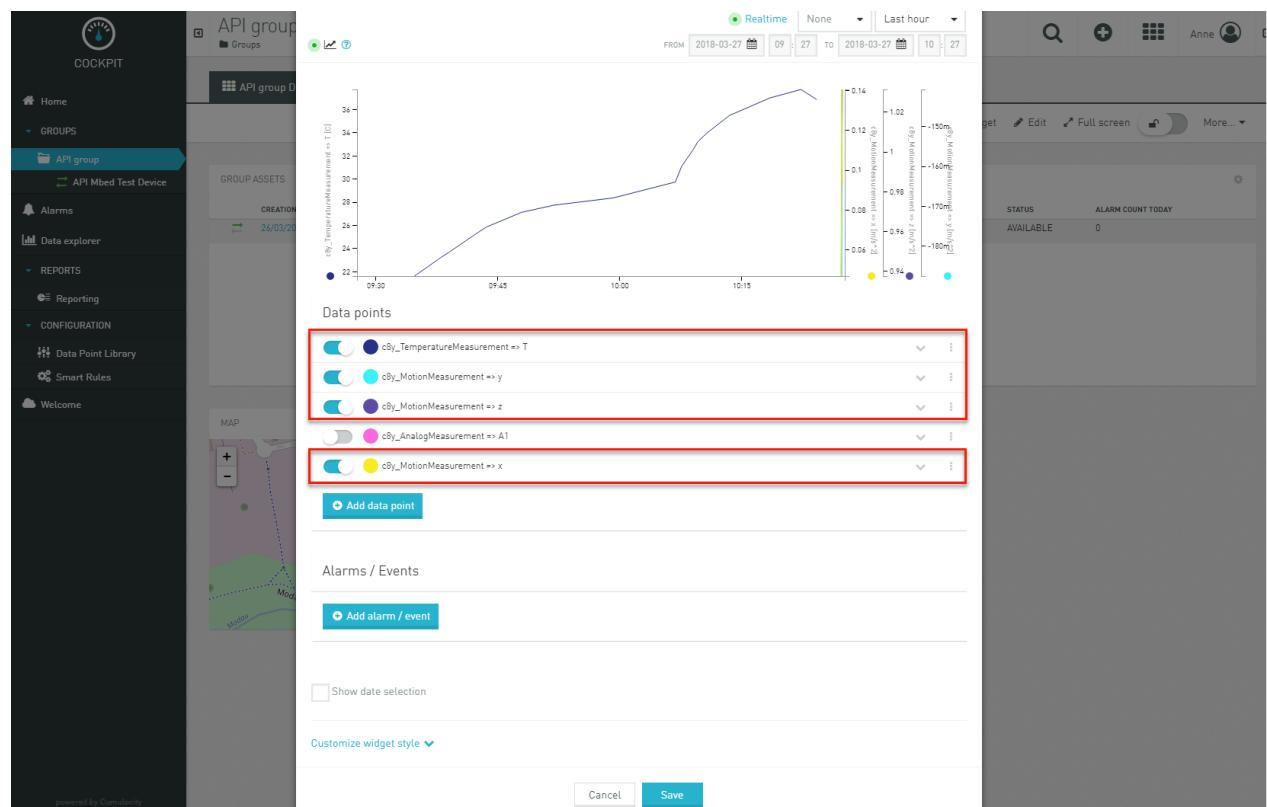

a. **Widget:** Data points graph

b. **Title:** <your userid> ublox device

c. **Label**

- i. c8y_TemperatureMeasurement => T
- ii. c8y_MotionMeasurement => x
- iii. c8y_MotionMeasurement => y
- iv. c8y_MotionMeasurement => z

In case one of the labels is missing click **Add data point** and select from the list.

Click **Save**.

This page intentionally left blank

Exercise 5: Create your Smart Rule

Objectives

In this exercise, you will create your smart rule. Using a smart rule Cumulocity includes a rule engine to analyze data in real-time and to perform actions based on data. These rules are specified in a scripting language and are managed in the **Administration** Application. The Cockpit application includes the **Smart Rules builder**. Using the **Smart Rules builder** rules can be created from templates.

Steps

1. Make sure that your device is installed, running and connected to the **Cumulocity** platform. If not refer to Exercise 1.
2. Login to **Cumulocity** tenant with your credentials. Open the URL <Cumulocity tenant url>.

<Cumulocity tenant url> as provided by the instructor.

Log in with the following credentials:

Username: - as defined in exercise 3 step 5 –

Password: - as provided in exercise 3 step 5 –

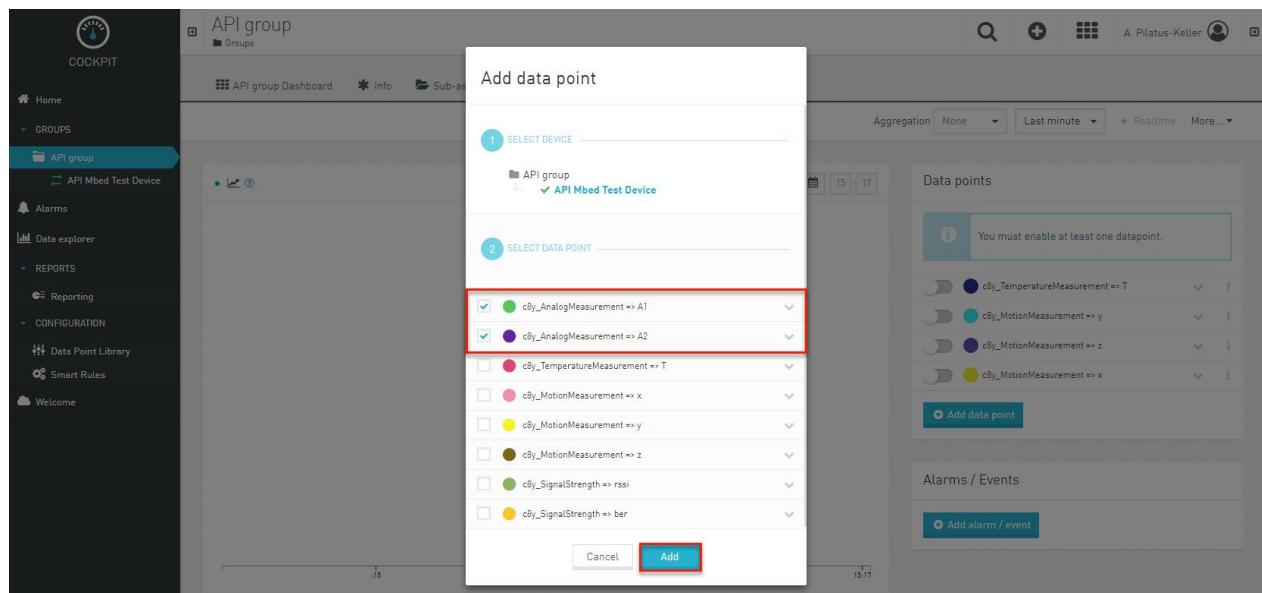

3. Open the **Cockpit** application through **Application Switcher**, the grid icon on the top right of the user interface. Select your group. Navigate to **Data Explorer**. Configure to see values for **c8y_AnalogMeasurement...** If needed, click **Add data point** to add sensor data to the explorer.

a. Click **Search**. Select the device <your prefix> Mbed Test Device.

b. Select the following data points.

i. **c8y_AnalogMeasurement => A1**

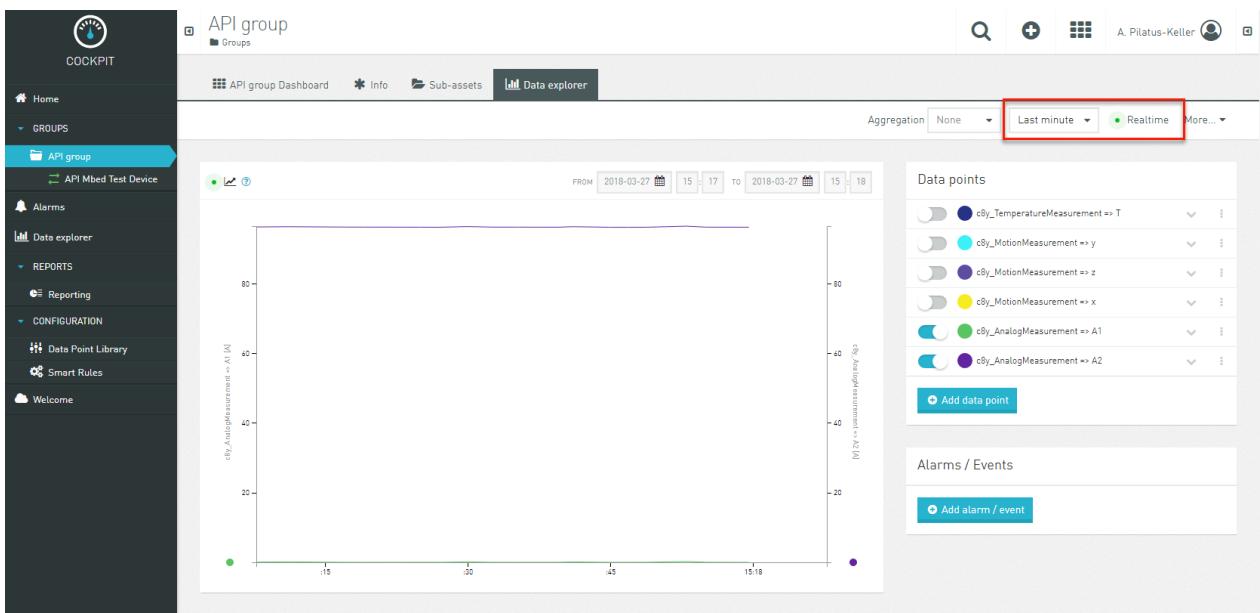

ii. **c8y_AnalogMeasurement => A2**

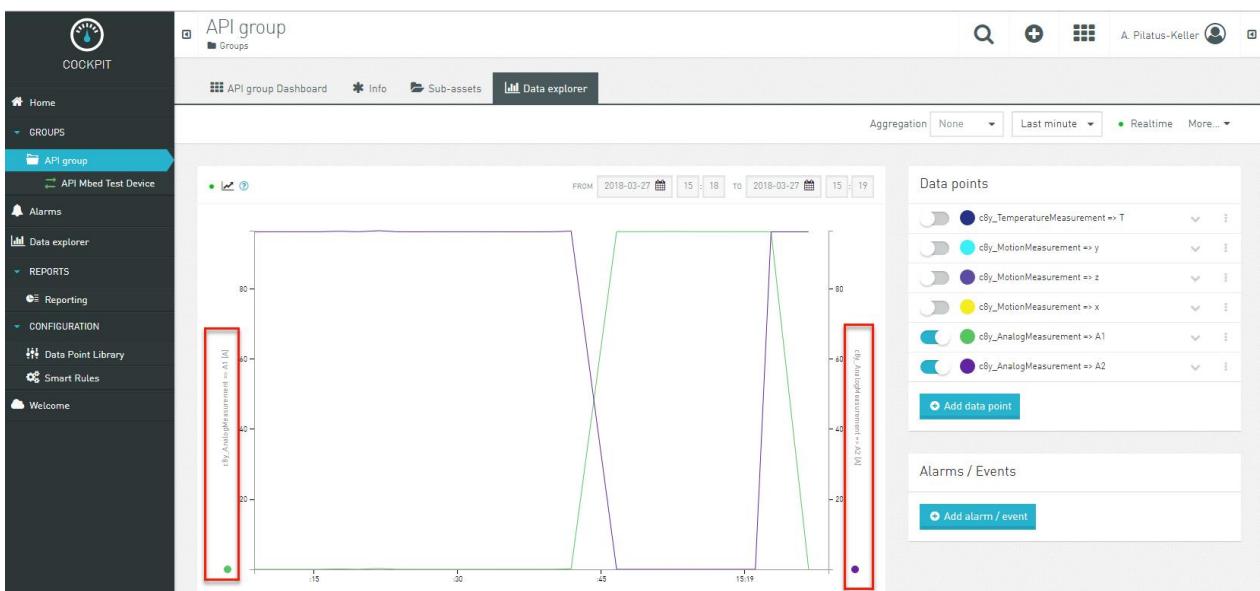

Click **Add** to visualize the data points in the graph.

4. Disable all other data points. Change the Filter to show **Realtime**, **Last minute**.

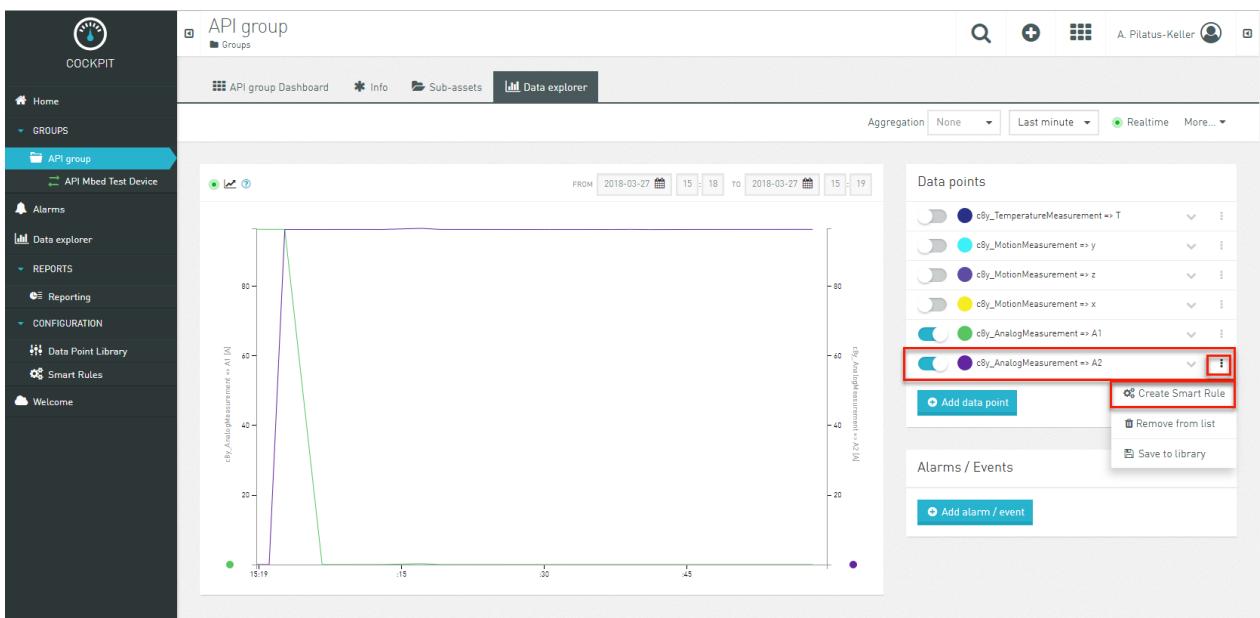

Exercise 5: Create your Smart Rule

5. Use the wheel on your device to enforce changes in the line. Move one of the wheels to the minimum limit and the other one to the maximum limit. This way you can see which line is representing which wheel. Decide for which of the wheel you would like to set up the alarm.

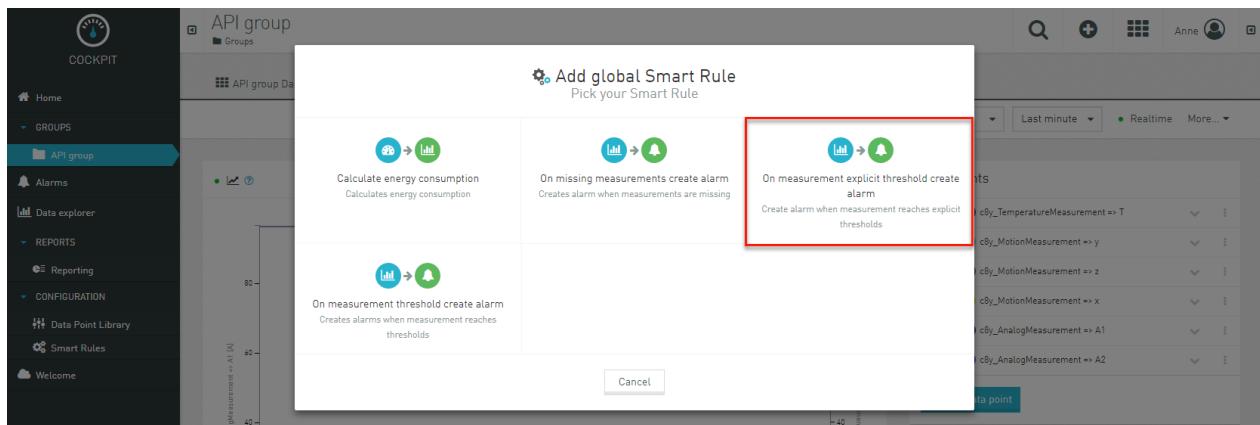

6. Select the data point from the list of labels and click the right most button in the row to open the command menu.

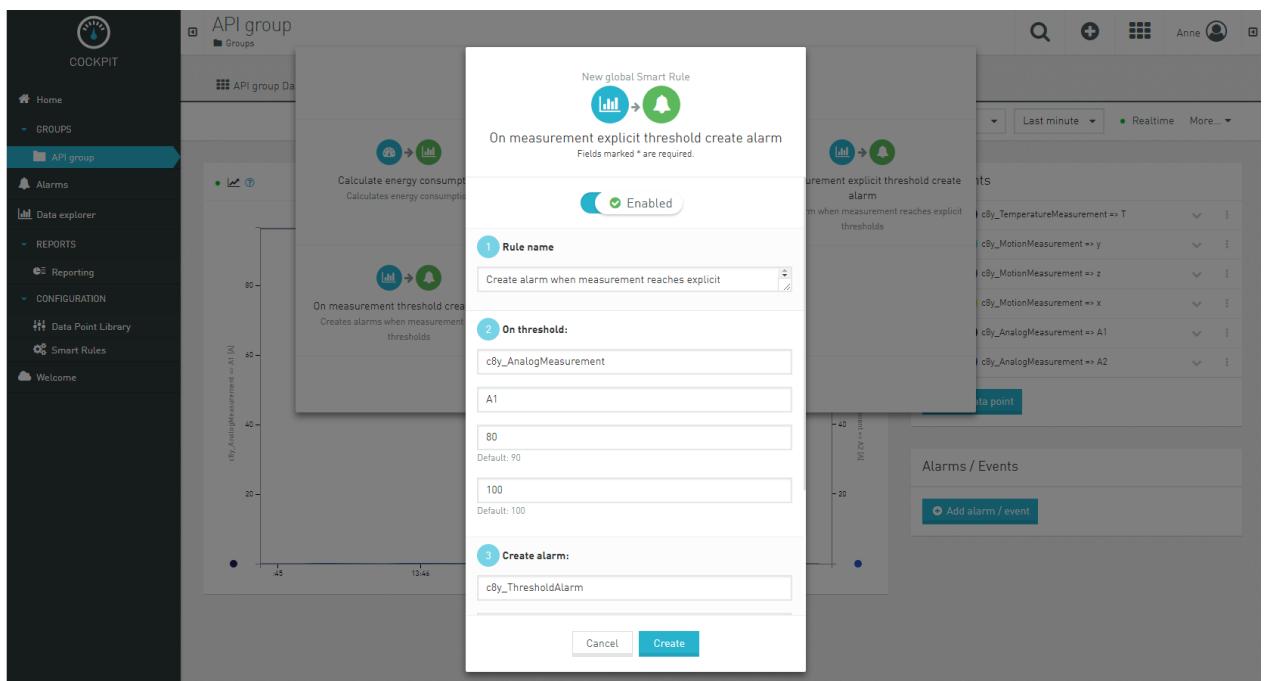

Select **Create Smart Rule** from the list.

7. Create a Smart Rule with the following parameters

- a. **Type:** On measurement explicit threshold create alarm

- b. Provide the following **create alarm** properties for the smart rule – hover the mouse over the fields will show the name of the property/field. Keep the defaults

Click **Create**.

8. Navigate to the **Info** tab of your group. You will find a list of **Smart Rules** at the bottom of the page. Verify the creation of the smart rule. The little green icon indicates that the rule is enabled.

9. Use the icon on the very right hand side of the smart rule row to see the **history of changes**.

10. As for now the **Smart rule** is not attached to any device, within the **Children** column it is listed as **None selected**. Open the drop box and search and select your mbed device.

The screenshot shows the 'API group' configuration page. On the left, a sidebar lists 'Home', 'Groups' (with 'API group' selected), 'Alarms', 'Data explorer', 'Reports', 'Configuration', 'Data Point Library', 'Smart Rules', and 'Welcome'. The main area is titled 'API group' and shows a 'Smart Rule' section. A red box highlights the 'Apply' button. The 'CHILDREN' section shows 'API Mbed Test Device' selected. The 'HISTORY OF CHANGES' section shows two entries: 'Smart Rule enabled' at 27 March 2018 15:32 and 'Smart Rule updated' at 27 March 2018 15:32.

Click Apply.

11. Move the wheel on your mbed application shield to enforce the smart rule sending the alarm message.
12. Navigate to **Alarms**. Leave the switch Show cleared alarms off to only show unresolved alarms. Use the toggle to show **Realtime**.

The screenshot shows the 'Alarms' page. The sidebar includes 'Home', 'Groups', 'API group' (selected), 'Alarms' (selected), 'Data explorer', 'Reports', 'Configuration', 'Data Point Library', 'Smart Rules', and 'Welcome'. The main area displays a 'CRITICAL' alarm for 'Threshold exceeded' on '27 March 2018 15:36' for 'API Mbed Test Device'. Below it are sections for 'MAJOR', 'MINOR', and 'WARNING' with no alarms listed. A red box highlights the 'Realtime' toggle switch at the top right.

13. You can also find the alarm when looking on the device detail page.

The screenshot shows the 'API Mbed Test Device' detail page. The sidebar includes 'Home', 'Groups', 'API group' (selected), 'Alarms' (selected), 'Data explorer', 'Reports', 'Configuration', 'Data Point Library', 'Smart Rules', and 'Welcome'. The main area displays the same 'CRITICAL' alarm for 'Threshold exceeded' on '27 March 2018 15:36' for 'API Mbed Test Device' as seen on the Alarms page.

14. Now we want to disable the rule. Navigate to your **group > Info > Smart rules** and select the new created rule from the list. Click the right most button in the row. Select the command **Edit** from the list.

The screenshot shows the 'API group' configuration page. In the center, there's a section for 'SMART RULE'. A specific rule is listed: 'Create alarm when measurement reaches explicit thresholds'. To the right of this rule is a context menu with options: 'Edit' (highlighted with a red box), 'Clone', 'Remove', and 'Inspect'. The main interface includes a sidebar with navigation links like Home, GROUPS, API group, Alarms, Data explorer, REPORTS, Configuration, Data Point Library, Smart Rules, and Welcome.

15. Change the value for red range (min) down to 30.

This screenshot shows the 'Edit global Smart Rule' dialog box. It has three sections: 1. Rule name: 'Create alarm when measurement reaches explicit'. 2. On threshold: 'cBy_AnalogMeasurement' and 'A2' are listed; the numerical value '30' is highlighted with a red box. 3. Create alarm: 'cBy_ThresholdAlarm'. At the bottom are 'Cancel' and 'Save changes' buttons, with 'Save changes' highlighted by a red box.

Click **Save changes**.

16. Move the wheel as before.

17. Review the **Alarms** page. Select the alarm listed under in the **Critical** section and hoover the mouse over the alarm. This will show additional icons to acknowledge the alarm or to mark the alarm as resolved.

The screenshot shows the 'API Mbed Test Device' Alarms page. It displays two alarms: one under 'CRITICAL' (threshold exceeded) and one under 'MAJOR' (no alarms to display). A context menu is open over the critical alarm, with the 'Acknowledge' button highlighted by a red box. The main interface includes a sidebar with navigation links like Home, GROUPS, API group, Alarms, Data explorer, REPORTS, Configuration, and Data Point Library.

Click the **Acknowledge** button, this will mark the alarm with a specific icon.

The screenshot shows the COCKPIT interface with the 'API group' selected in the sidebar. The main area displays the 'API Mbed Test Device' details, including an 'Alarms' tab which is currently active. A single critical alarm is shown: 'Threshold exceeded' at 27 March 2018 15:49 for the 'API Mbed Test Device'. There is a green toggle button at the bottom right of the alarm card.

Click the **mark as resolved** icon to delete the alarm in the list.

18. Use the toggle button to de-activate the rule.

The screenshot shows the COCKPIT interface with the 'API group' selected in the sidebar. The main area displays the 'API group' configuration, specifically the 'SMART RULE' section for a rule named 'Create alarm when measurement reaches explicit thresholds'. A red box highlights the 'Deactivate for this group' toggle switch, which is currently off. Other settings visible include 'None selected' for assets and a description of the rule's function.

This page intentionally left blank

Exercise 6: Export data as a Report

Objectives

In this exercise, you will use Cumulocity to create a report covering some of the device properties. The report will be created as Excel sheet and can be send to your email account.

Steps

1. Make sure that your device is installed, running and connected to the Cumulocity platform. If not refer to Exercise 1.
2. Login to **Cumulocity** tenant with your credentials. Open the URL <Cumulocity tenant url>.

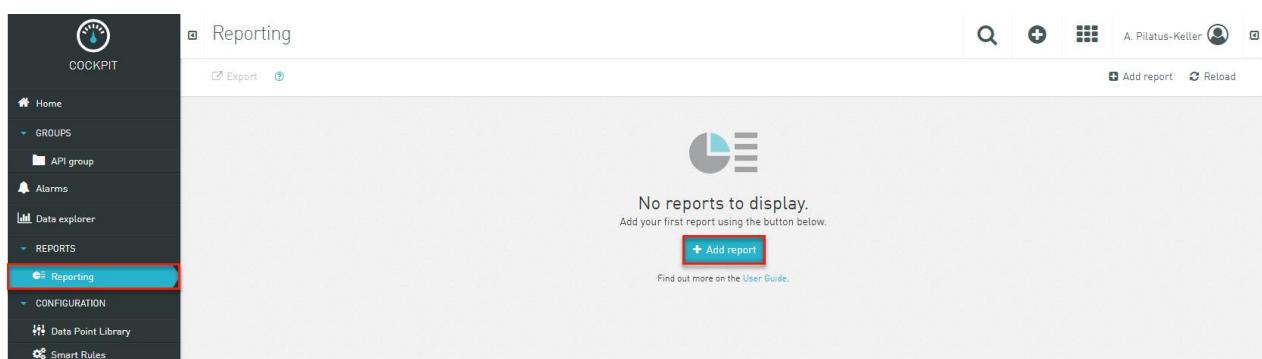

<Cumulocity tenant url> - as provided by the instructor.

Log in with the following credentials:

Username: - as defined in exercise 3 step 5 –

Password: - as provided in exercise 3 step 5 –

3. Open the **Cockpit** application through **Application Switcher**, the grid icon on the top right of the user interface. Navigate to **Reports > Reporting**.
4. Click the **+ Add report** button to create a new report.

5. Provide the following properties
 - a. **Name:** <your userid> first report
 - b. **File Type:** Excel
 - c. **Filters:**
 - i. **Objects to export:** - select your group –
 - ii. **Time range:** Last week
 - d. **Fields:**
 - i. Use the toggle button to include **Alarms**
 - ii. Use the **+ Add predefined** button to add columns to the report. From the list of predefined columns select all properties, except the properties **Time** and **Device name**. Click **Select**.

The screenshot shows the Data Cockpit interface with the 'Reporting' section selected. A configuration dialog is open for creating a new report named 'API first report'. In the 'FIELDS' section, there is a 'SELECT' button which has been clicked, opening a modal window titled 'Select properties'. This modal lists several properties with checkboxes:

SHOW	LABEL	PROPERTY
<input checked="" type="checkbox"/>	Creation time	creationTime
<input type="checkbox"/>	Device name	DEVICE_NAME
<input checked="" type="checkbox"/>	ID	id
<input checked="" type="checkbox"/>	Reoccurrence count	count
<input checked="" type="checkbox"/>	Severity	severity
<input checked="" type="checkbox"/>	Source	source
<input checked="" type="checkbox"/>	Status	status
<input checked="" type="checkbox"/>	Text	text
<input type="checkbox"/>	Time	time
<input checked="" type="checkbox"/>	Type	type

At the bottom right of the modal are 'Cancel' and 'Select' buttons, with 'Select' being the active one.

Click **Select**. Click **Save**.

a. **Fields:**

- iii. Use the toggle button to include **Alarms**
 - iv. Use the **+ Add predefined** button to add columns to the report. From the list of predefined columns select all properties, except the properties **Time** and **Device name**. Click **Select**.
6. In order to create another report which is sending measurements do the following
- a. Within Fields
 - i. Use the toggle button to include **Measurements**
 - ii. Use the **+ Add from datapoint** button to add columns to the report. From the list of datapoints select **c8y_AnalogMeasurment => A1** and **c8y_AnalogMeasurment => A2**.

Click **Select**. Click **Save & Close**.

- From the list within Reporting select your new created report and click **Export**.

- For each of the selection an email is sent to your Outlook account including a link to the report in Cumulocity.
- Use the link to open the report of alarms.

	A	B	C	D	E	F	G	H	I	J	K	L	M	N	O	P
1	Time	Device name	Creation time	ID	Recurrence count	Severity	Source	Status	Text	Type

This page intentionally left blank

Exercise 7: Work with Alarms

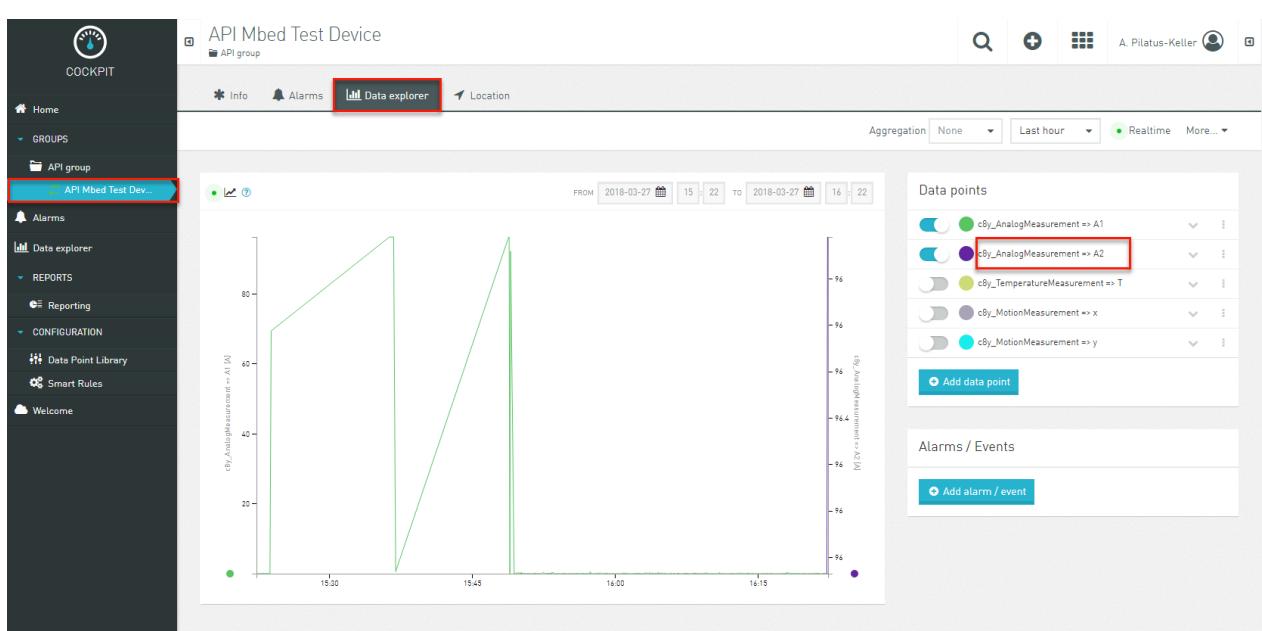

Objectives

In this exercise, you will work with Alarms. Devices can raise alarms to indicate that there is a problem requiring an intervention. Alarms can be viewed in different places.

- By clicking on **only unresolved** in the Alarms tab to see alarms of all devices that have not been cleared yet.
- By clicking on **Alarms** in the Navigator to see the entire alarm history
- By clicking on a device and selecting the **Alarms tab** to see the alarms of that device. By default only unresolved alarm as are shown, but you can disable the **Only unresolved** check box to see all alarms.

Steps

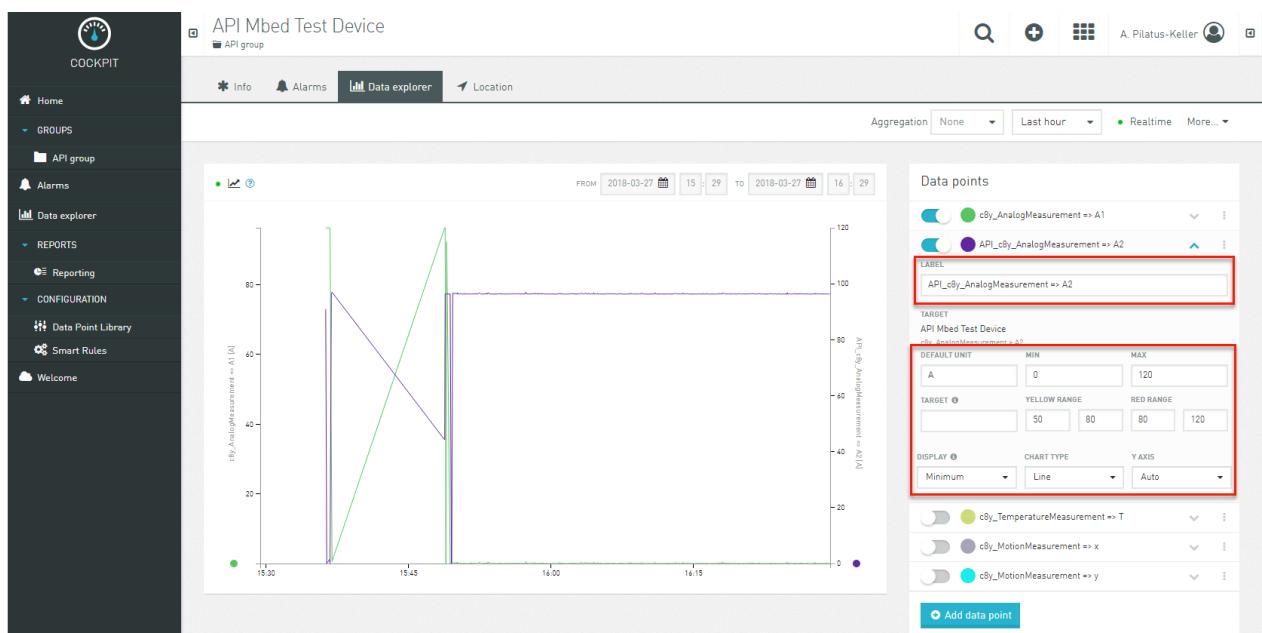

1. Make sure that your device is installed, running and connected to the Cumulocity platform. If not refer to Exercise 1.
2. Login to **Cumulocity** tenant with your credentials. Open the URL <**Cumulocity tenant url**>
<Cumulocity tenant url> - as provided by the instructor.
Username: - as defined in exercise 3 step 5 -
Password: - as provided in exercise 3 step 5 -
3. Working with alarms needs the creation of a threshold on a reading from the kits. Thresholds are, by default, global. Therefor the label of the reading must be unique by adding e. g. your name to it. We configure the existing data point. Navigate to your device in your group and select **Data explorer**.
Select the data point c8y_AnalogMeasurement => A2

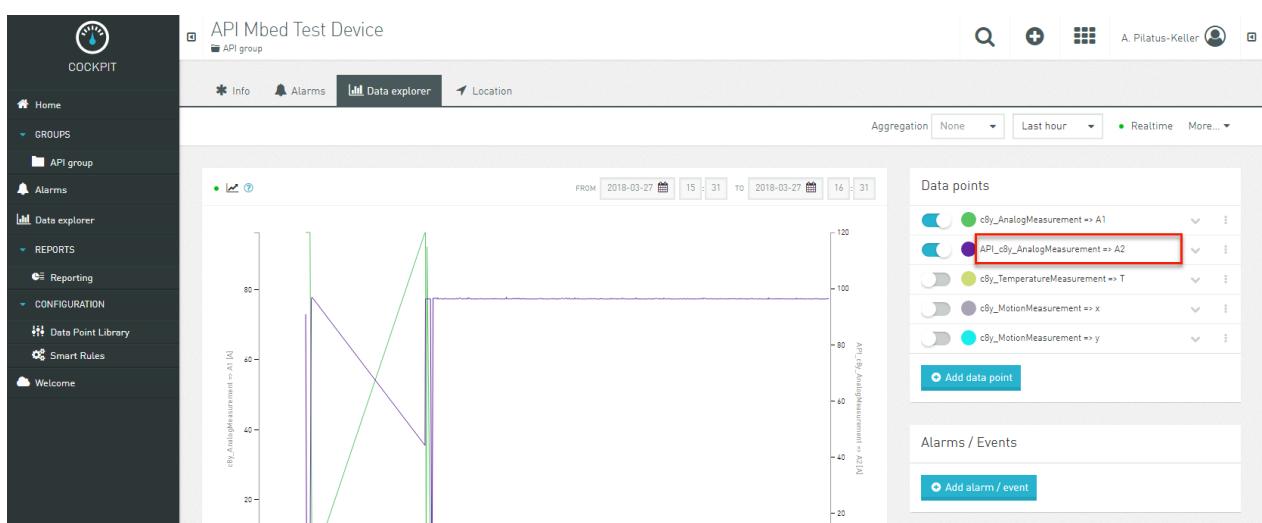

This will open the detail page of this data point.

4. Provide the following properties to the data point
 - Label:** <your userid>_c8y_AnalogMeasurement_A2
 - Default Unit:** A

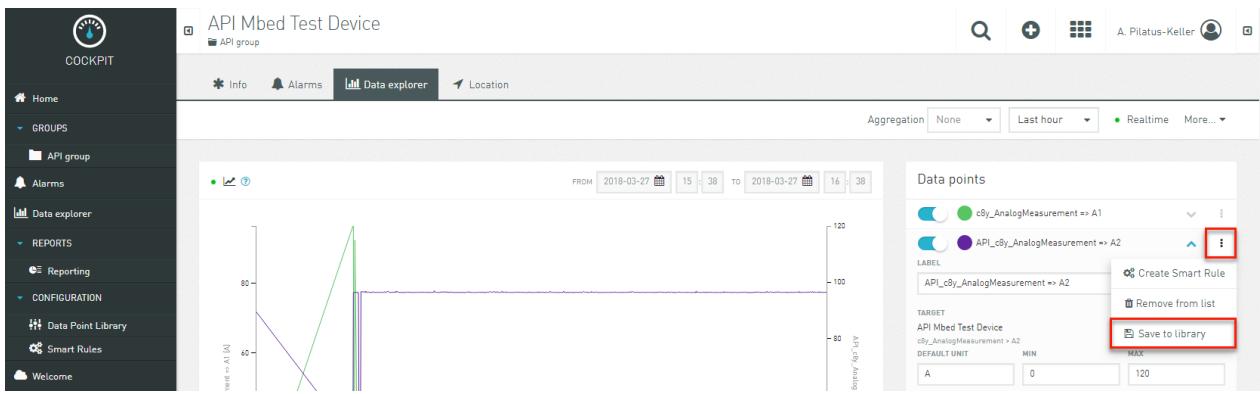

- c. **Minimum:** 00
- d. **Maximum:** 120
- e. **Target:** - leave empty -
- f. **Yellow Range (min):** 50
- g. **Yellow Range (max):** 79
- h. **Red Range (min):** 80
- i. **Red Range (max):** 120
- j. **Display:** Minimum
- k. **Chart Type:** Line
- l. **Y Axis:** Auto

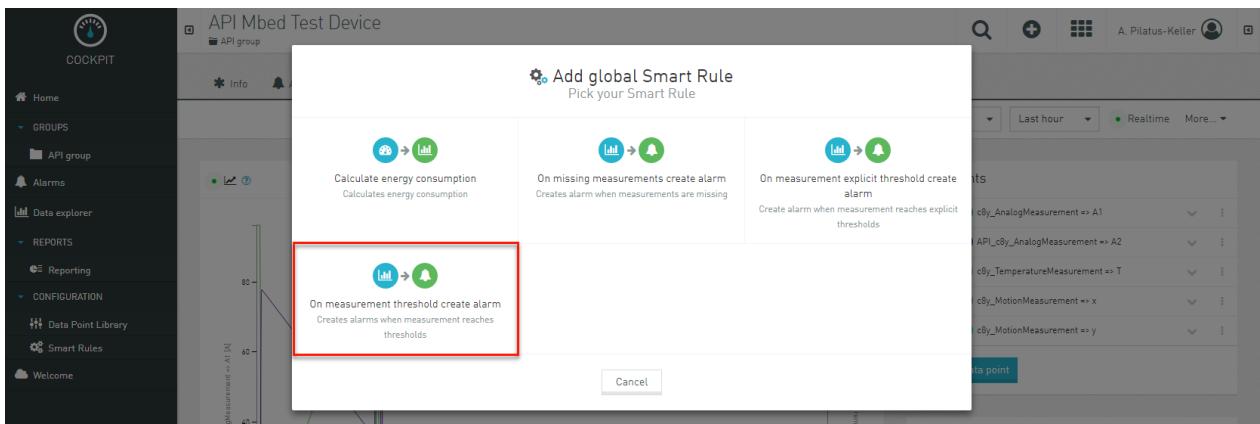

Close the detail section of this data point. You will see the data point listed with your label.

5. Select your new created data point and click the right most button in the row to open the menu. Select Save to library to save the definition of your data point to the library.

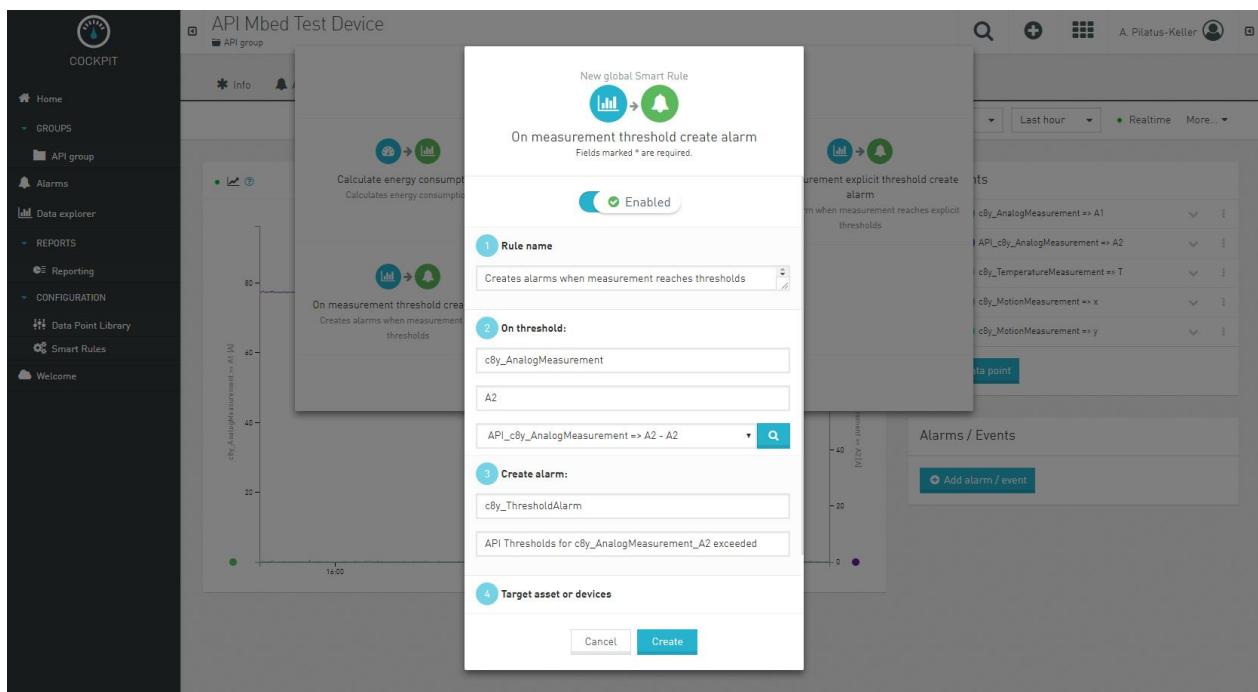

- Select the your new created data point and click the right most button in the row and select the command to create a new smart rule. Select the Smart Rule **On measurement threshold create alarm**.

- Provide the following properties:

- Rule name**
 - leave the default –
- On threshold**
 - Fragment:** – leave the default –
 - Series:** – leave the default –
 - Drop-down box:** - select the data point definition that you have just created -
- Create alarm**
 - Type:** – leave the default –
 - Text:** <your userid> Thresholds for c8y-AnalogMeasurement_A2 exceeded

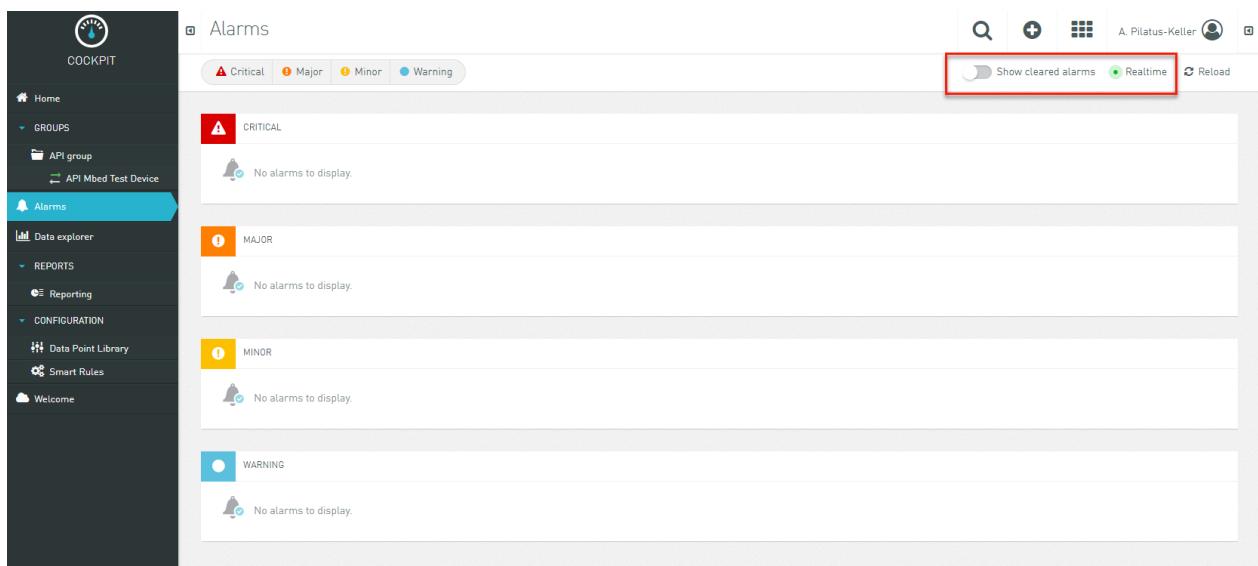

Click **Create**.

8. Select **Info** tab of your device. The new **Smart Rules** is listed.

9. Navigate to **Alarms** and click on **Realtime**.

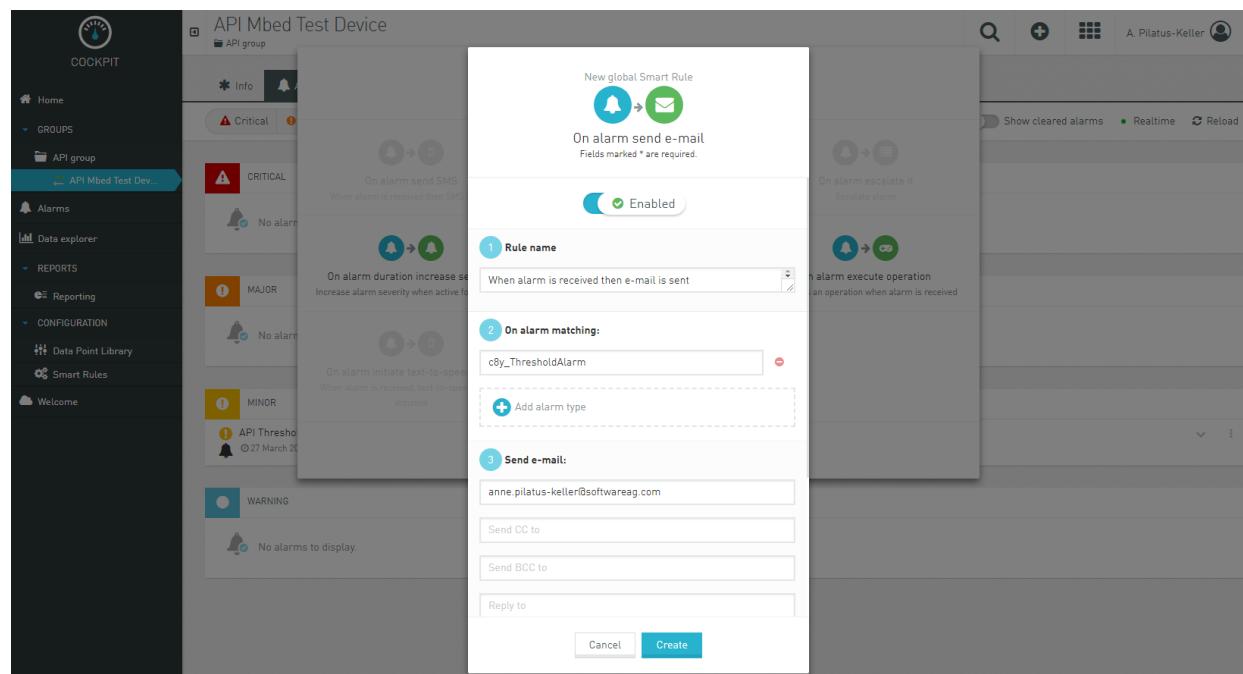

10. Manipulate your sensors on the kit to raise an alarm.

- Forward Alarm to your email account. Look on the list of Alarms of your device. Hover over the alarm and click the right most button in the row. From the list of command select **Create Smart Rule**.

- Select **on alarm send e-mail**

- Leave all Defaults. Your email address should be already listed in the **Send to** text field.
- Optionally, give the rule a name on the top left and edit the content of the email.

Click **Create**.

12. Use the device to generate a new alarm, This alarm should go to your email.

Exercise 8:

Experiment with Device Lifecycle

Objectives

In this exercise, you will simulate to install a device somewhere else while keeping its old data.

Steps

1. Make sure that your device is installed, running and connected to the Cumulocity platform. If not refer to Exercise 1.
2. Login to **Cumulocity** tenant with your credentials. Open the URL <**Cumulocity tenant url**>
<Cumulocity tenant url> - as provided by the instructor.
Username: - as defined in exercise 3 step 5 -
Password: - as provided in exercise 3 step 5 -
3. Navigate to **Device Management** application. Select **All devices** and navigate to your device.
4. Select the **Identity** tab.

```

*new 1 - Notepad++ [Administrator]
File Edit Search View Encoding Language Settings Tools Macro Run Plugins Window ?
File Explorer Task List new 1
1 Type: c8y_Serial
2 External ID: 359316074883593
Normal text file length : 48 lines : 2 Ln : 2 Col : 17 Sel : 0 | 0 Windows (CR LF) UTF-8 INS

```

5. Delete the registered identity by clicking the **Delete** icon on the right side of the table entry. Hover the mouse over the table entry.

Confirm the deletion.

Exercise 8: Experiment with Device Lifecycle

6. Restart your device. After your device has started up, navigate to **Device Management > All devices**. Note that there is a second device with the same serial number. This device is live while your original device is archived including all its data.

STATUS	NAME	MODEL	SERIAL NUMBER	GROUP	REGISTRATION DATE	SYSTEM ID	IMEI	ALARMS
Archived	RaspPi BCM2701 00000000000000000000000000000000	RaspPi BCM2701	00000000000000000000000000000000	Api WidgetTest	15 May 2018 16:31	4524		1 ● 0 ○

Live	Mbed Test Device	Ublox C827	359316074823593		24 May 2018 14:45	22610	359316074823593	1 ● 1 ○
Archived	API MQTT device	MQTT test model		Api WidgetTest	3 May 2018 14:01	519		1 ● 1 ○
Archived	KW-L21	KW-L21	WHDU176170011%	Smartphones	8 May 2018 12:44	566		2 ● 0 ○
Live	Mbed Test Device	Ublox C827	359316074823593	Annes Devices	8 May 2018 14:25	1479	359316074823593	

7. Select the newly registered device and review **device and communication** within the **Info** tab.

8. Now we want to temporarily prevent a device from sending data into the tenant. Within the **Device Status** section search for the **owner**. In case you don't see the owner there is a problem with the rendering. The **Device Status** section has a scrollbar, scroll down until you see the **owner**.

9. Use the slider to deactivate the device owner.

10. Navigate to System **Device Management > Management > Device Credentials**. Your device is listed as **Disabled**.

The screenshot shows the 'Device management' sidebar with various options like Home, Devices, Overviews, Groups, and Device types. Under 'Management', the 'Device credentials' option is selected. The main area displays a table titled 'Device credentials' with four entries. The fourth entry, 'device_359316074883593', is highlighted with a red border and has the status 'Disabled' displayed below it.

11. From the list of **Device credentials** select your device credentials. Within **Identification** there is a similar slider to enable/disable the device user as you have used before within the Info tab of your device.

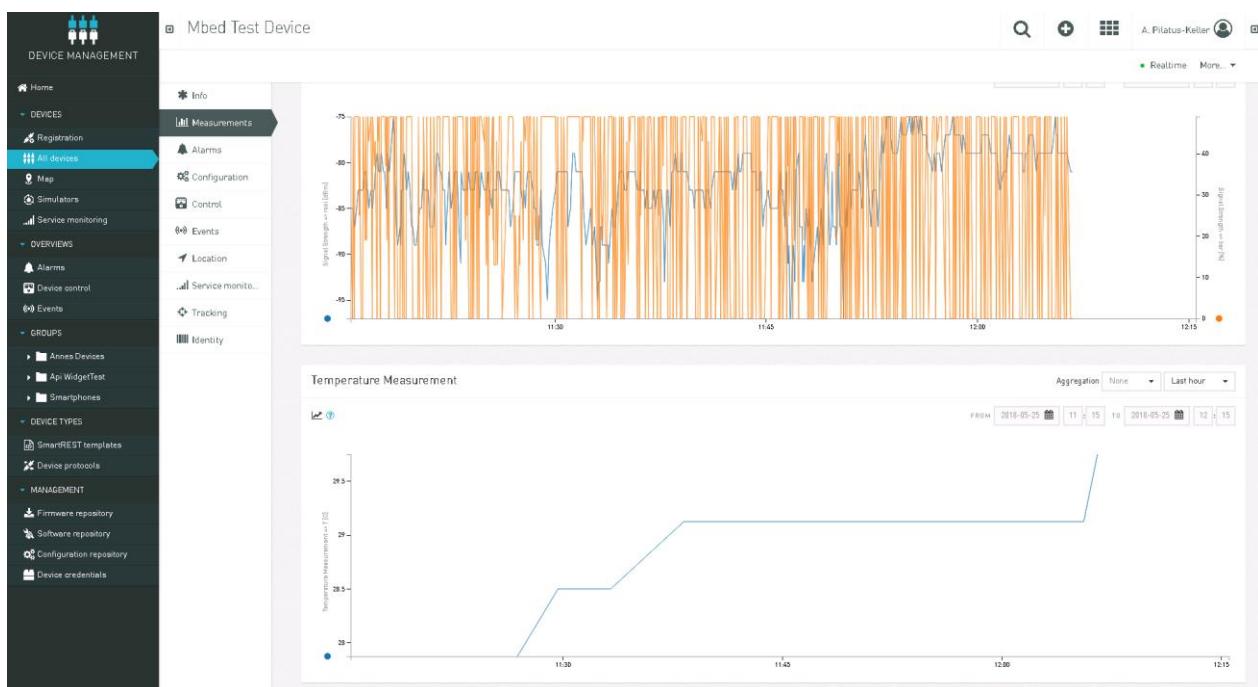

This screenshot shows the 'Identification' configuration page for a specific device credential. It includes fields for 'USERNAME' (set to 'device_359316074883593') and an 'ACTIVE' slider which is currently set to 'Disabled'.

12. Navigate back to **Device Management > All devices** and select your device. Review the date of the last communication and check that the **last communication** is before disabling the device user.

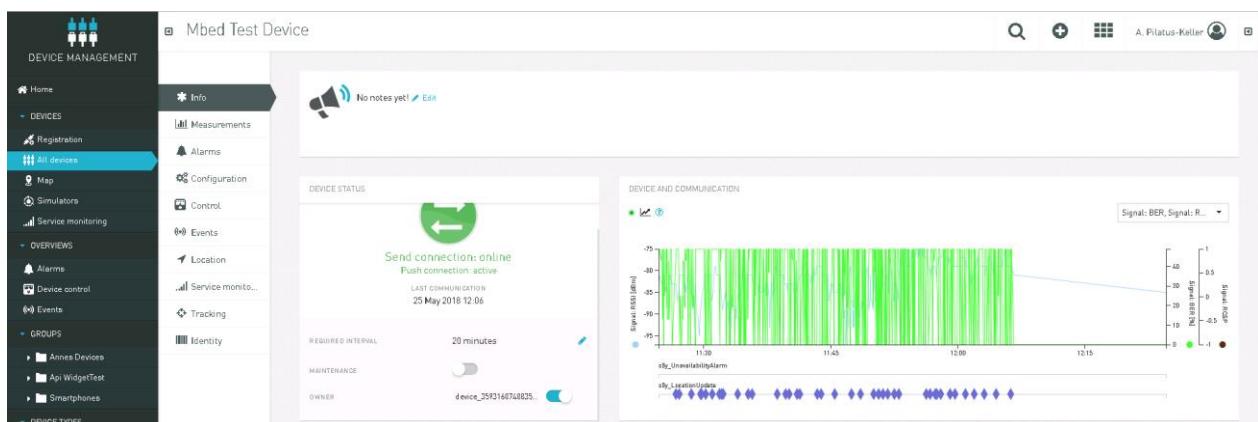

The screenshot shows the 'All devices' list under 'Device management'. One device, 'Mbed Test Device', is selected. In the 'Info' tab, the 'LAST COMMUNICATION' field is highlighted with a red border and shows the date '25 May 2018 12:06'. To the right, there is a detailed 'DEVICE AND COMMUNICATION' section with a signal strength graph and a timeline of events.

Navigate to **Measurements** and verify that no measurements are sent after disabling the device user.

Exercise 8: Experiment with Device Lifecycle

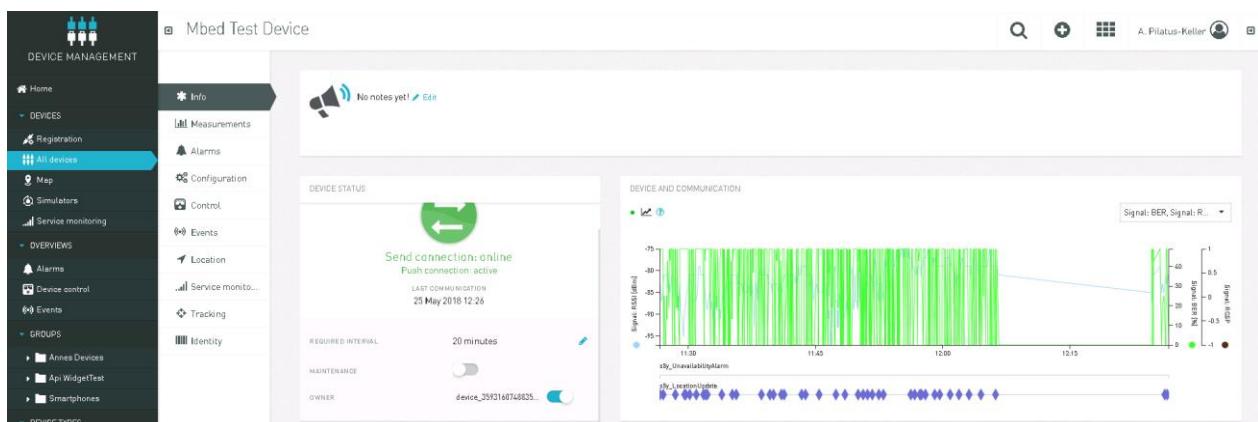

13. Now we want to enable the device user. Navigate to **Info > Device Status** section. Use the slider to enable the device user.

14. Restart the device. The device continuous sending measurements.

15. Navigate to **Device Management > All devices** and select your device. Check that the date of the last communication is up to date and the Measurements are updated.

Exercise 9: Create Inventory Role

Objectives

In this exercise, you will experiment with permissions. You define an inventory role which you assign to specific user. The user should only have the permission to see a particular set of devices. For these devices the user should only have access to see device information and **c8y_TemperatureMeasurement**.

Steps

1. Make sure that your device is installed, running and connected to the Cumulocity platform. If not refer to Exercise 1.
2. Login to **Cumulocity** tenant with your credentials. Open the URL **<Cumulocity tenant url>**
<Cumulocity tenant url> - as provided by the instructor.
Username: - as defined in exercise 3 step 5 -
Password: - as provided in exercise 3 step 5 -
3. Navigate to **Administration** application and click on **Roles** menu. Add a new role from the Inventory roles tab. The users in this inventory role should only have the permission to see a particular set of devices. For these devices the user should only have access to see device information and the **c8y_TemperatureMeasurement**.
4. Create a new Inventory Role which allows access to only temperature measurement and device information
 - a. **Name:** <Cumulocity login id> First Inventory role
 - b. **Description:**
 - c. **Section Inventory:**
 - i. **Type:** *
 - ii. **Permission:** Read
 - d. **Section Measurements:**
 - i. **Type:** c8y_AnalogMeasurement
 - ii. **Permission:** Read

API First inventory role

NAME: API First inventory role

DESCRIPTION: reduce Visibility to just c8y_Temperature on uBlox Devices

Inventory

Measurements

TYPE: c8y_AnalogMeasurement	PERMISSION: Read
-----------------------------	------------------

5. Add another permission to the section **Measurement** to allow access to all types:

- a. **Type:** *
- b. **Permission:** Read

This will show an exclamation mark on the **c8y_TemperatureMeasurement**. The exclamation mark indicates that the permission is not effective, because another “higher” permission set for the user already includes the respective permission.

API First inventory role

NAME: API First inventory role

DESCRIPTION: reduce Visibility to just c8y_Temperature on uBlox Devices

Inventory

Measurements

TYPE: c8y_AnalogMeasurement	PERMISSION: Read
TYPE: +	PERMISSION: Read

Remove the permission you have defined giving access to all measurements.

API First inventory role

NAME: API First inventory role

DESCRIPTION: reduce Visibility to just c8y_Temperature on uBlox Devices

Inventory:

- TYPE: * PERMISSION: Read
- Measurements** (highlighted with a red box)
 - TYPE: c8y_AnalogMeasurement PERMISSION: Read

6. Navigate to **Cockpit** and create a new group named <softwareag userid>Dashboards. Assign the ublox device to it. Create a group dashboard.

- Assign your device to it
- Create a group dashboard and assign a number of widgets to the dashboard

API Dashboards

API Group Dashboard

MAP

MESSAGE SENDING

7. Navigate to **Administration > Users** and select the user to whom you want to give the new role. You either add a new user with your private email address or you work together with your neighbour and decide whom to gives this role.

- When creating a new user account refer to exercise 2.
 - Provide as username: <softwareag userid>Customer
 - Within **Global Roles** just provide the role **Cockpit User**.
- When using an existing the user account, edit the user and change the **Global roles** to just the role **Cockpit User**.

The screenshot shows the 'APICustomer' user creation page. In the 'Identification' section, fields include 'USERNAME (E.g. E-MAIL)' with 'APICustomer', 'ACTIVE' status set to 'Enabled', 'E-MAIL' with 'anne.pilatuskeller@gmail.com', 'FIRST NAME' with 'Carl', 'LAST NAME' with 'Customer', and 'TELEPHONE' with '+49 9 876 543 210'. Under 'LOGIN OPTIONS', there are two unchecked checkboxes: 'User must reset password on next login' and 'Send password reset link as e-mail'. In the 'PASSWORD' section, both 'PASSWORD *' and 'CONFIRM PASSWORD *' fields contain '*****', and the 'password strength' is marked as 'strong'. On the right side, the 'Global roles' section lists various roles with checkboxes. The 'Cockpit User' role is checked and highlighted with a red box. Other listed roles include 'readers', 'Global Manager', 'DeviceManagement User', 'Simulator Admin', 'admins', 'business', and 'devices'. At the bottom right are 'Cancel' and 'Save' buttons.

8. Select Inventory Role tab.

- With the new role you want to reduce the access to the measurements sent by your device.
The first step when assigning an inventory role is to select the group which contain your asset.

The screenshot shows the 'Inventory roles' tab of the user management interface. It displays a list of groups: 'API Dashboards', 'API group', 'Api WidgetTest', and 'Smartphones'. Each group has a dropdown menu labeled 'Select inventory roles...'. To the right, a tooltip defines an 'inventory role' as containing permissions that can be attached to devices and groups of devices. It also mentions that roles can be copied from another user or replaced. At the bottom are 'Cancel' and 'Save' buttons.

- Click **Select inventory roles**. Select the role you have just created

Click Apply.

c. Review the configuration of the Inventory roles

Click Save.

9. Start a new Brower session and login as the user which you have just configured to have restricted permissions. If needed provide a new password.

Click Set password.

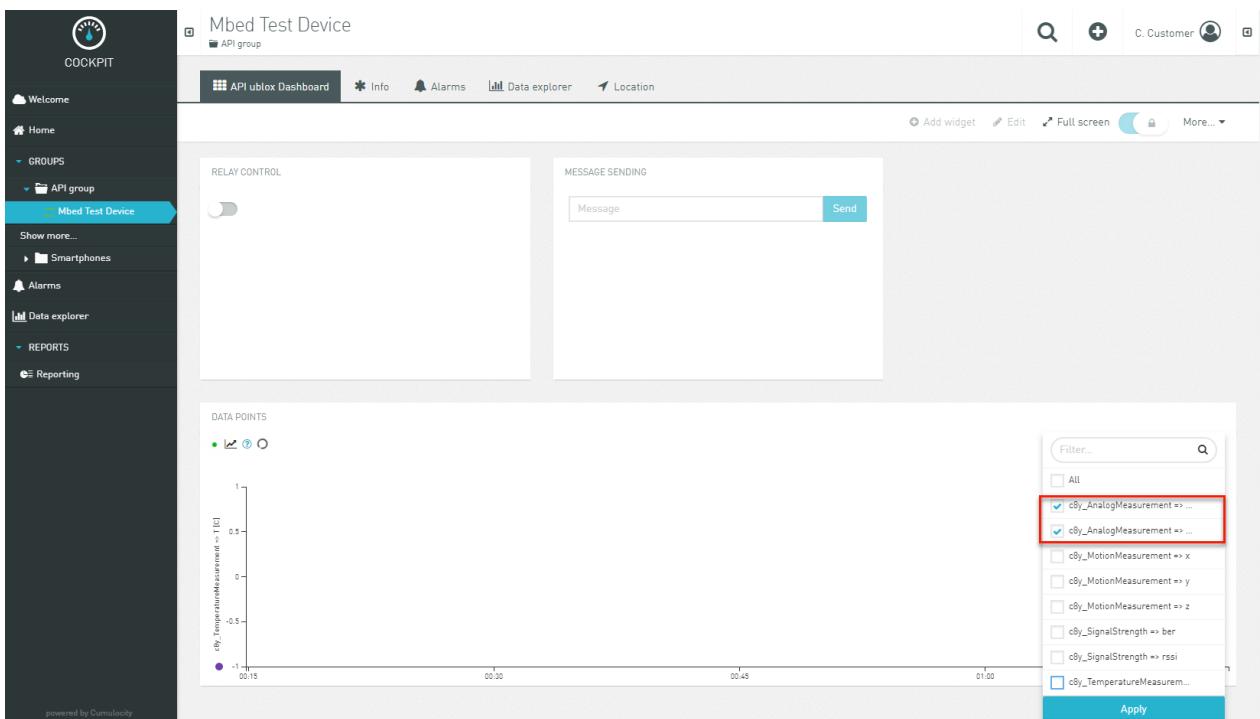

10. You will be directed to the **Cockpit** application. This is the only application the user has access to. The only groups the user can see are the groups for which we have assigned the inventory role.

The screenshot shows the Cockpit application's Groups page. The sidebar on the left is dark with white text and icons. The 'GROUPS' section is expanded, showing 'API group' and 'Smartphones' under it. Other sections like 'Home', 'Alarms', 'Data explorer', 'Reports', and 'Reporting' are also listed. The main content area has a light gray background. It displays two groups: 'API group' and 'Smartphones'. Each group has a small icon, the group name, and 'NUMBER OF CHILDREN 1' below it. There are three horizontal ellipsis dots next to each group entry.

11. Open the group and from the list of devices select the device. Depending on the selected widget and the configured measurements in the widget you might get a warning concerning missing access privileges.

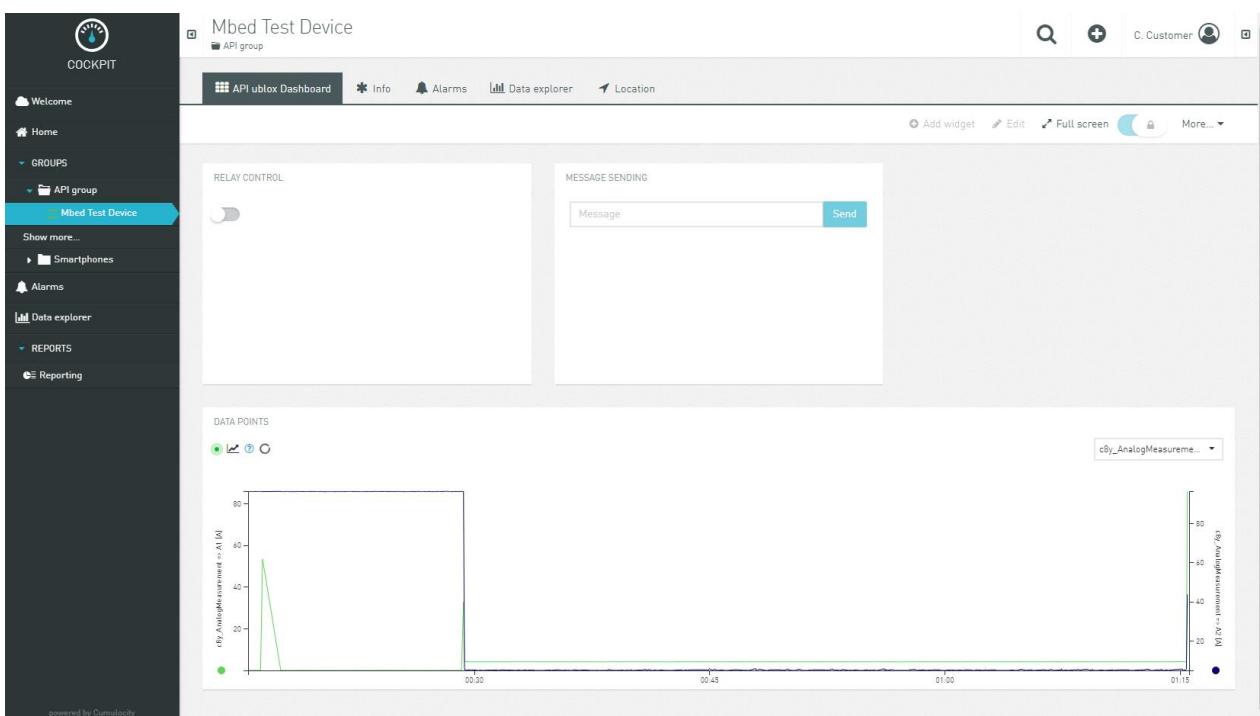

The screenshot shows the Cockpit application's Mbed Test Device page. The sidebar on the left is dark with white text and icons. The 'GROUPS' section is expanded, showing 'API group' and 'Mbed Test Device' under it. The 'API group' and 'Mbed Test Device' items are highlighted with a blue background. Other sections like 'Home', 'Alarms', 'Data explorer', 'Reports', and 'Reporting' are also listed. The main content area has a light gray background. It displays a warning message in a yellow box: 'The application requested data your user does not have access to. Please check the user menu for more details.' Below the message are three buttons: 'Add widget', 'Edit', and 'Full screen'. Further down are sections for 'RELAY CONTROL' (with a slider), 'MESSAGE SENDING' (with a 'Message' input field and 'Send' button), and 'DATA POINTS' (with a graph showing a single data point at -1). The graph has a y-axis labeled 'c8y_TemperatureMeasurement [-1]' ranging from -1 to 1, and an x-axis with time markers at 00:15, 00:30, 00:45, and 01:00. A dropdown menu for 'c8y_TemperatureMeasurement' is visible on the right side of the graph area.

12. Click the close icon on the warning.
13. Navigate to the Data Points widget and change the listed measurements to show only **c8y_AnalogMeasurement => A1** and **c8y_AnalogMeasurement => A2**.

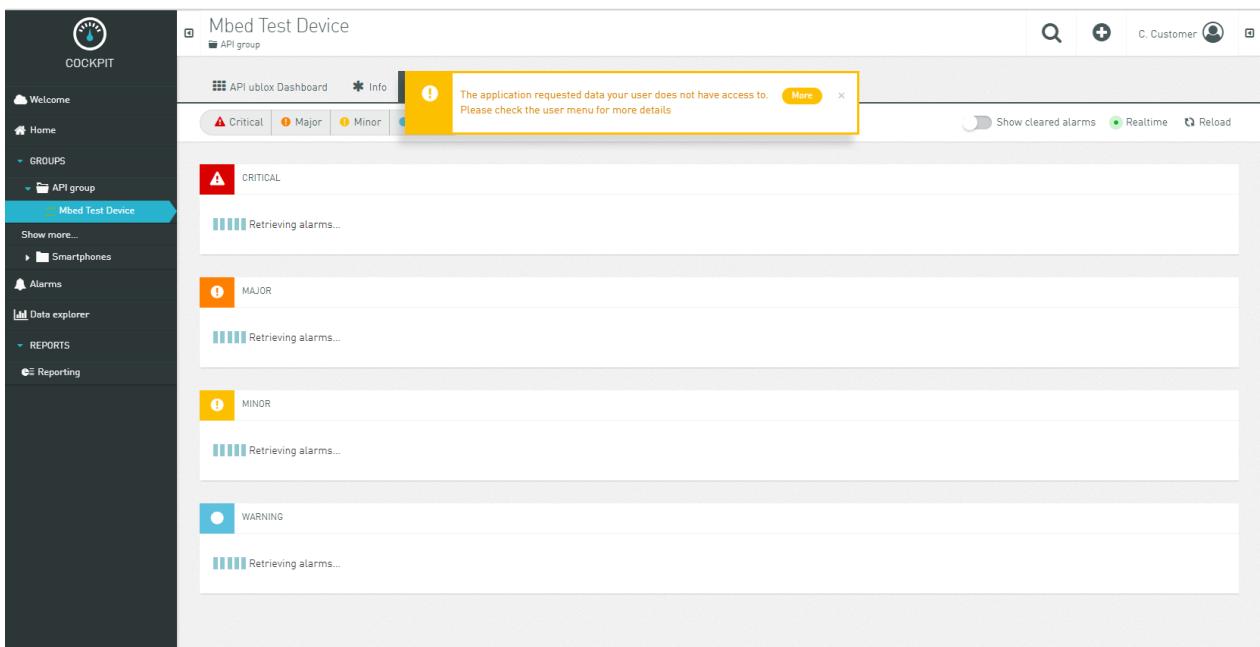

Click Apply.

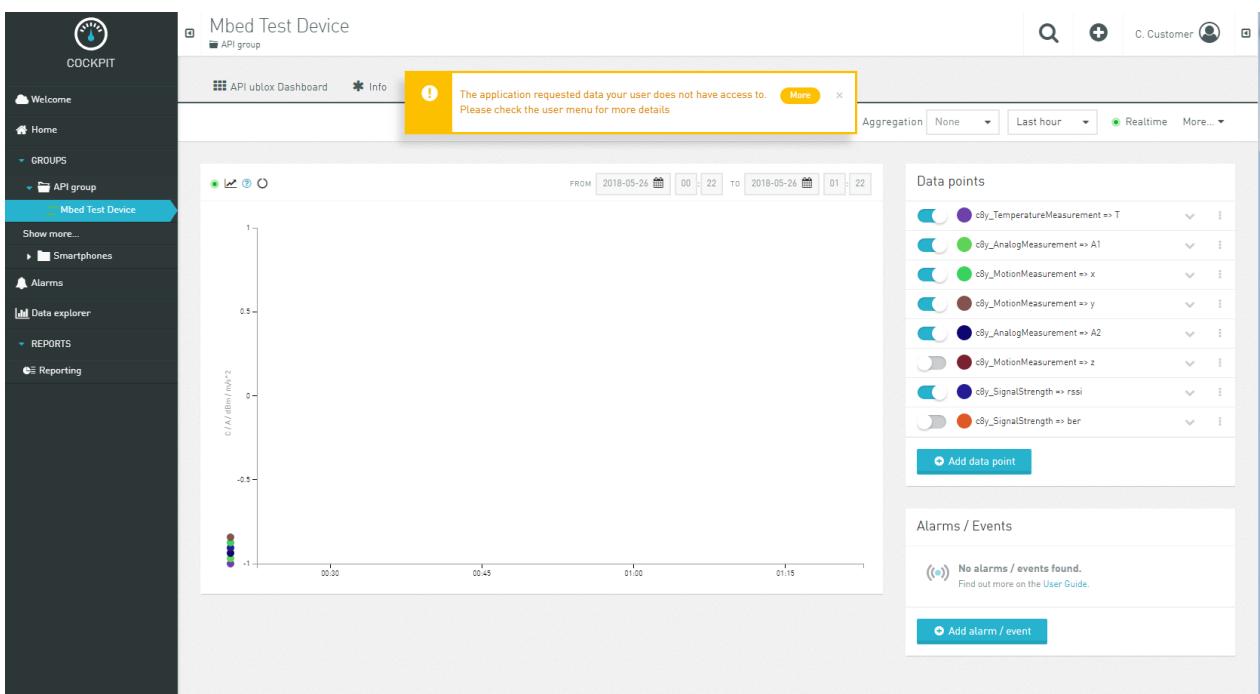

14. The Data Point widget will show **AnalogMeasurement =>A1** and **AnalogMeasurement =>A2**.

15. Navigate to Alarms widget. You will again get an error, because we haven't assign privileges to see alarms.

16. Navigate to Data explorer widget. Add additional data points to the widgets. This will lead into a warning, because in the inventory role we gave users assign to this rile only access to **c8y_AnalogMeasurement**.

If a user has inventory access to a group of devices, the user will also have that access to all dashboards for that group of devices in the **Cockpit** application.

Exercise 10: Create a Simulator

Objectives

In this exercise, you will work with the Cumulocity Simulator which provides you with the feature to simulate all aspects of IoT devices. Following steps are covered:

- Setup up a simulated device and specify which operations the device can process
- Create work instructions based on predefined message templates and schedule work steps
- Create a number of devices (up to ten) of a defined type
- Generate messages for measurements, alarms, events and inventory

Steps

1. Login to **Cumulocity** tenant with your credentials. Open the URL <Cumulocity tenant url>.

<Cumulocity tenant url> - as provided by the instructor.

Username: - as defined in exercise 3 step 5 -

Password: - as provided in exercise 3 step 5 -

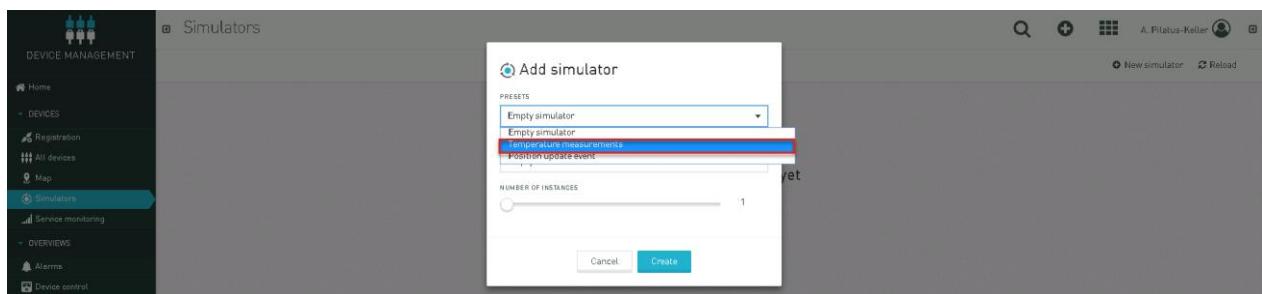

2. Select the **Administration** application. Navigate to **Roles**. Select the **admins** role. Within the list of permissions select the type **Simulator** and click the **Admin** permission. This is the only available check box.

The screenshot shows the Cumulocity Administration interface with the 'ADMINISTRATION' application selected. On the left, the navigation menu includes 'Home', 'ACCOUNTS', 'Users', 'Roles' (which is highlighted in blue), 'Audit logs', 'APPLICATIONS', 'Own applications', 'BUSINESS RULES', 'Event processing', 'Alarm mapping', 'MANAGEMENT', 'Retention rules', 'Files repository', 'SETTINGS', 'Application', 'Password', 'Properties library', 'OpenT Credentials', and 'Connectivity'. The main content area is titled 'admins' and shows a table of permissions. The table has columns for 'TYPE', 'NAME', 'DESCRIPTION', and four permission checkboxes: 'READ', 'ADMIN', 'CREATE', and 'UPDATE'. The 'Simulator' row is highlighted with a red box. Under the 'Admin' column for the 'Simulator' row, the 'checkbox' is checked. A note at the bottom of the table says: 'A global role contains generally applicable permissions. Select, for example, "read" in the row "Inventory", if you want to permit a user in this role to access the whole inventory with all devices.' Below the table is a note: 'To choose which applications this role should have access to please remove all "Application management" permissions.' At the bottom right of the table are 'Cancel' and 'Save' buttons.

Click **Save**. Confirm saving changes.

The screenshot shows the Cumulocity Administration interface with the 'ADMINISTRATION' application selected. The 'Roles' section is visible on the left. A modal dialog box is centered on the screen with the title 'Confirm saving changes?'. It contains the text 'Are you sure you want to edit the global role? Please enter "wpPiz" to confirm:' and a 'CONFIRM' button with a placeholder 'Type here...'. At the bottom of the dialog are 'Confirm' and 'Cancel' buttons. In the background, the 'admins' role configuration page is partially visible.

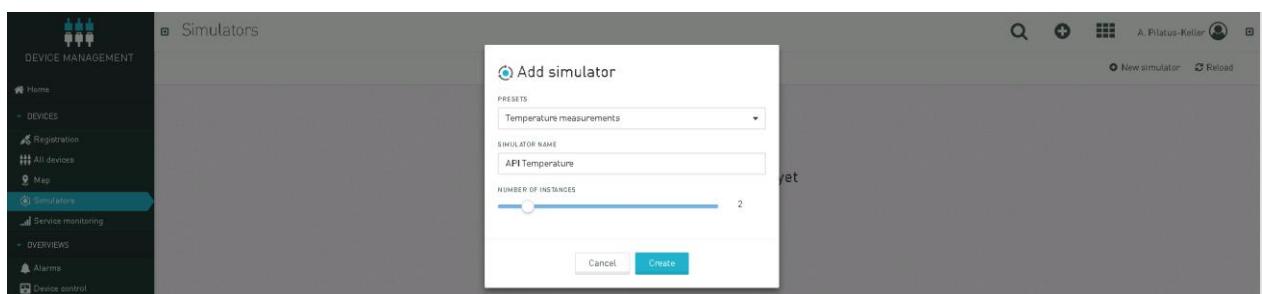

3. Switch over to **Device Management** application. Navigate to **Simulators**. If case you don't see the **Simulators** in the navigation menu refresh the page.
4. Click **New Simulator**. From the list of different simulator types select the Temperature Simulator.

Provide the following properties:

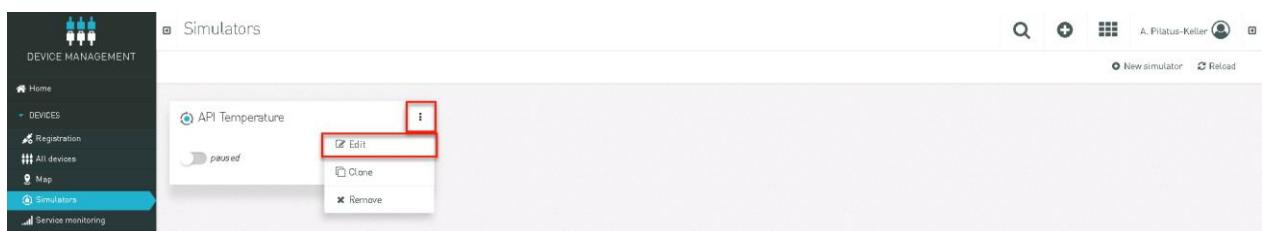

Simulator Name: <softwareag userid> Temperature

Number of instances: 2

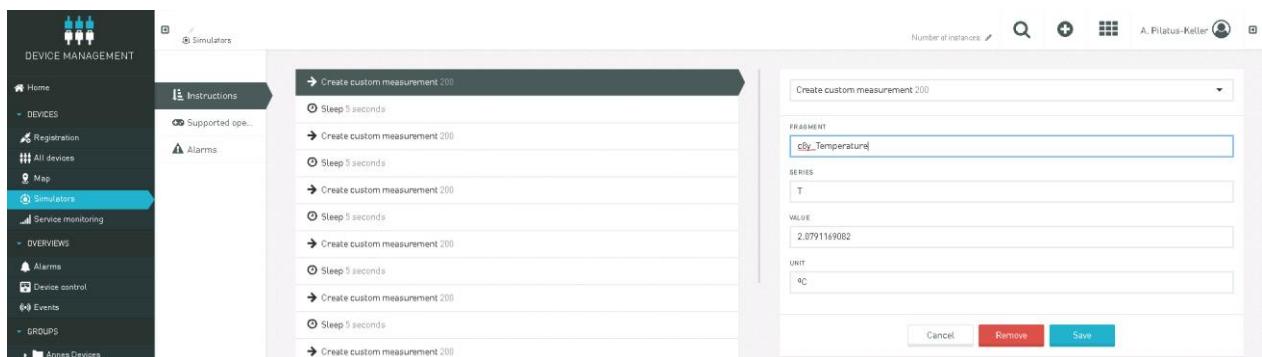

Click **Create**.

5. From the list of Simulators select the one you have just created. Open the Actions menu and select **Edit**.

Review the playlist. Select one of the instructions **Create custom Measurement 200**.

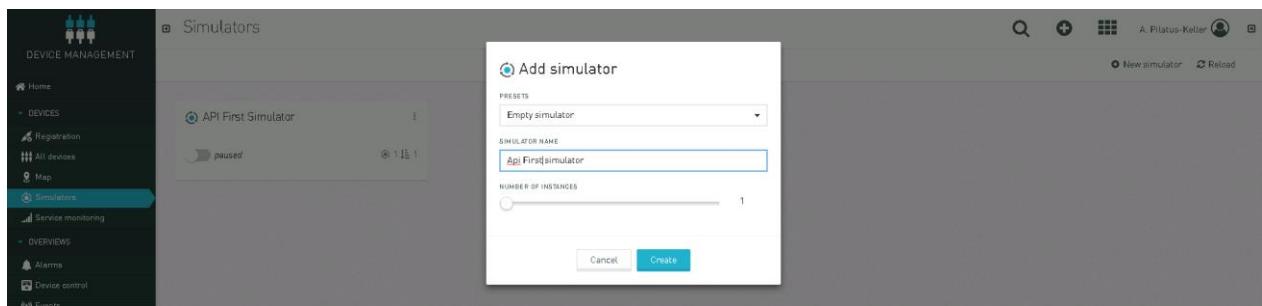

6. Next you want to configure a simulator with your own playlist. Go back to the list of Simulators and click **New Simulator** and provide the following properties:

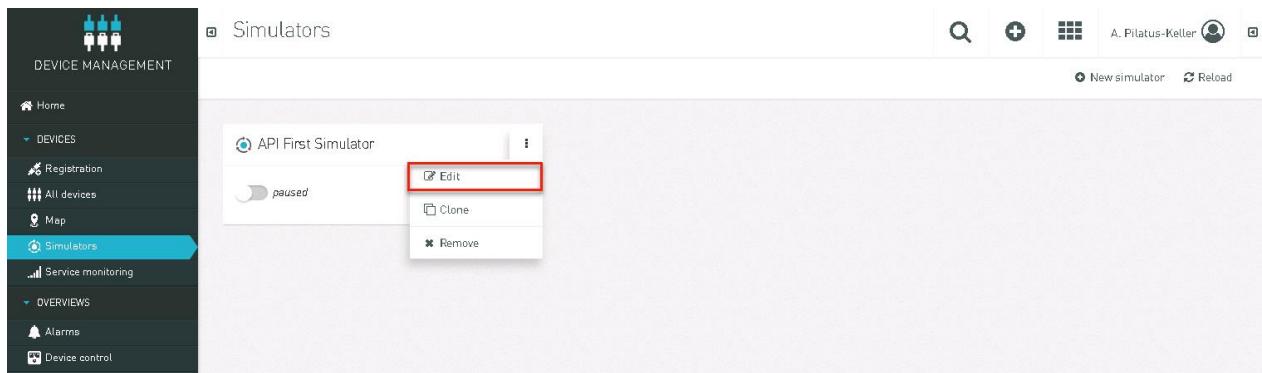

a. **Type:** Empty Simulator

b. **Name:** <softwareag userid> First Simulator

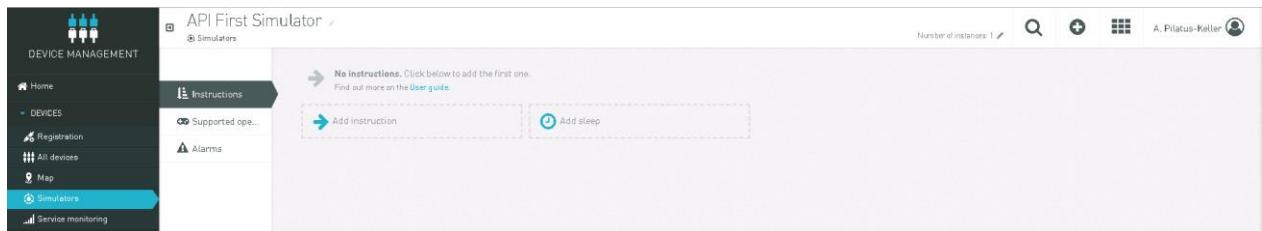

c. Number of instances: 1

7. Select the new simulator open the menu and select **Edit**.

8. Within edit mode you can add instructions which define what your simulator is supposed to do. Instructions are single tasks added to a playlist through which the simulator will work.

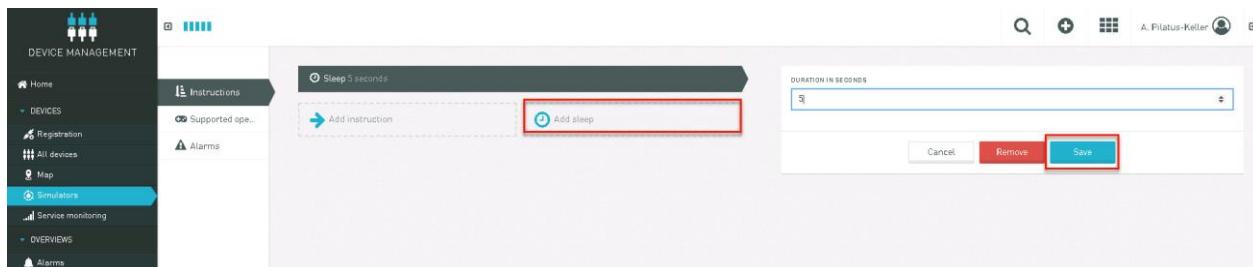

- a. Open the file **C:\Training\231-70E\Exercise8\SimulatorInstructions.txt**. This contains a set of instructions which you can use as a suggestion to configure your Simulator.

```

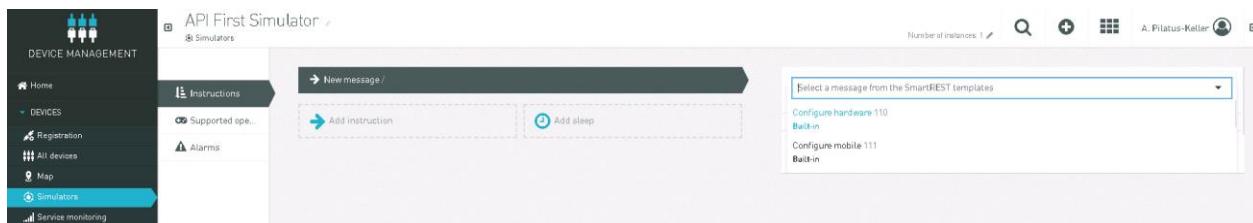

1 sleep 5 seconds
2 send 3 events:
3 400 EVENT_READY "Machine ready for operation"
4 400 EVENT_COUNTER 5
5 400 EVENT_RUNNING "Production in progress"
6 send 4 custom measurements
7 200 ["OIL_TEMPERATURE","1","42","C"]
8 200 ["PIECE_REMAINING","LENGTH","500","m"]
9 200 ["PIECE_CURRENT","LENGTH","10","A"]
10 200 ["PIECE_REMAINING","TIME","5","s"]
11 sleep 5 seconds
12 send 4 custom measurements
13 200 ["OIL_TEMPERATURE","1","60","C"]
14 200 ["PIECE_REMAINING","LENGTH","480","m"]
15 200 ["PIECE_CURRENT","LENGTH","15","A"]
16 200 ["PIECE_REMAINING","TIME","10","s"]
17 sleep 5 seconds
18 send 4 custom measurements
19 200 ["OIL_TEMPERATURE","1","50","C"]
20 200 ["PIECE_REMAINING","LENGTH","460","m"]
21 200 ["PIECE_CURRENT","LENGTH","20","A"]
22 200 ["PIECE_REMAINING","TIME","15","s"]
23

```

- b. Click **Add sleep**. Leave the default setting.

- c. Click **Add instructions**. Open the drop down menu.

- d. Select **Create basic event 400** and provide the properties. You can use the instructions for events as listed in file C:\Training\231-70E\Exercise8\SimulatorInstructions.txt which you have opened in step 8a.

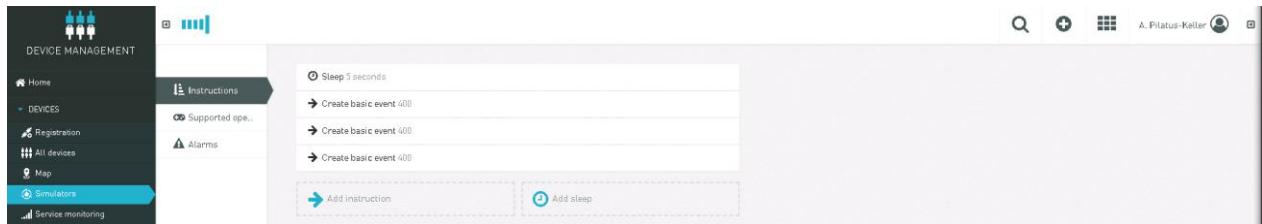

- Type: EVENT_READY
- Text: Machine ready for operation

EVENT

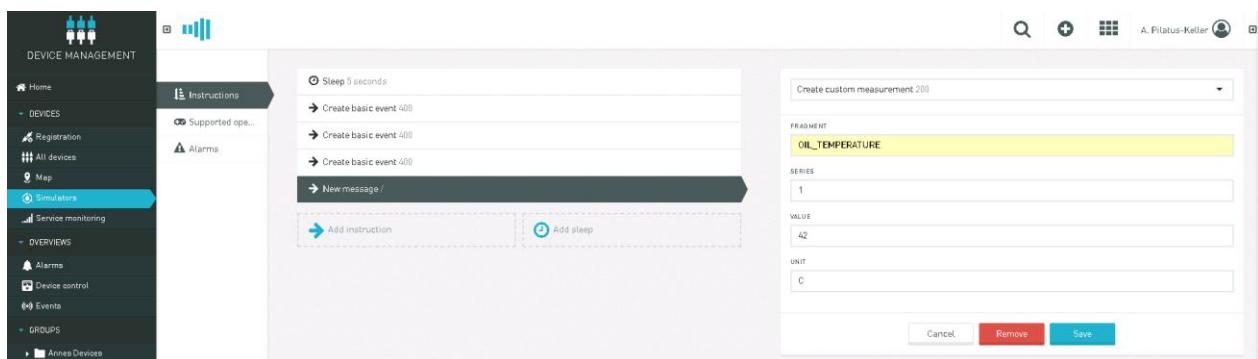

Click Save.

- e. Add the 3 events to the playlist as listed in file.

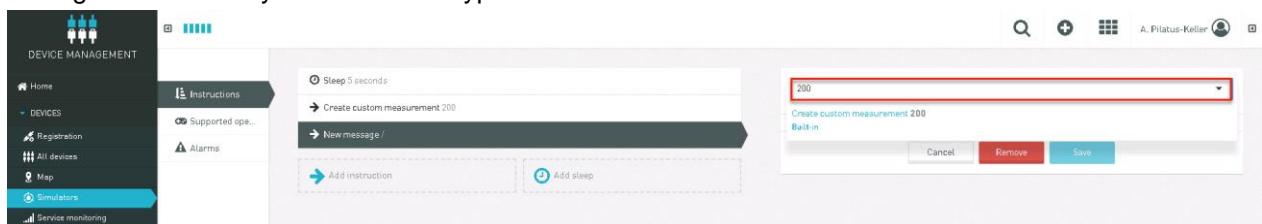

9. Next you want to add some measurements. Select **Create custom measurement 200** and provide the properties. You can use the instructions as listed in file **C:\Training\231-70E\Exercise8\SimulatorInstructions.txt** which you have used already:

- i. **Fragment:** OIL_TEMPERATURE
- ii. **Series:** 1
- iii. **Value:** 42
- iv. **Unit:** C

Click Save.

10. Provide the set of instructions of type **Create custom Measurement 200** as listed in the file. When adding an instruction you can use the type **200** as search criteria.

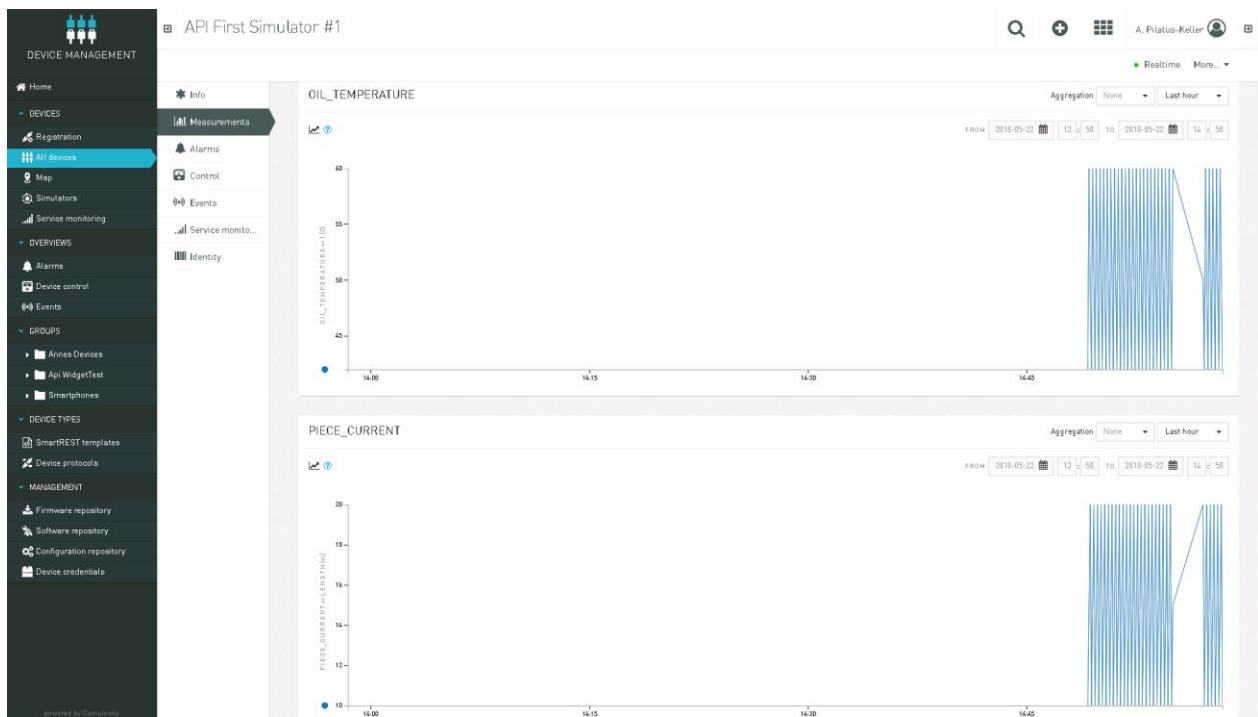

After adding all the custom measurements your simulator should look like the following.

11. Navigate back to the list of all **Simulators**. Your simulator is listed with the number of actions and the number of instances you have configured. Start the simulator using the slider.

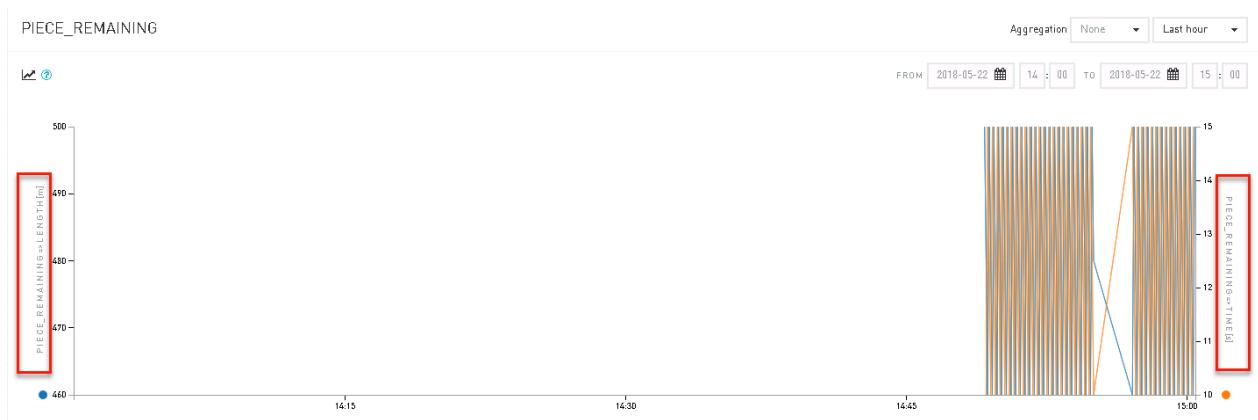

This will run the events and the measurements as you have configured. When the end of the list is reached, the simulator will start from the beginning of the list.

12. Review the Simulator shown under **All devices**. In case you don't see the simulator refresh the page. Your simulator is listed with its name followed by #1 which represents the first instance of the simulator.

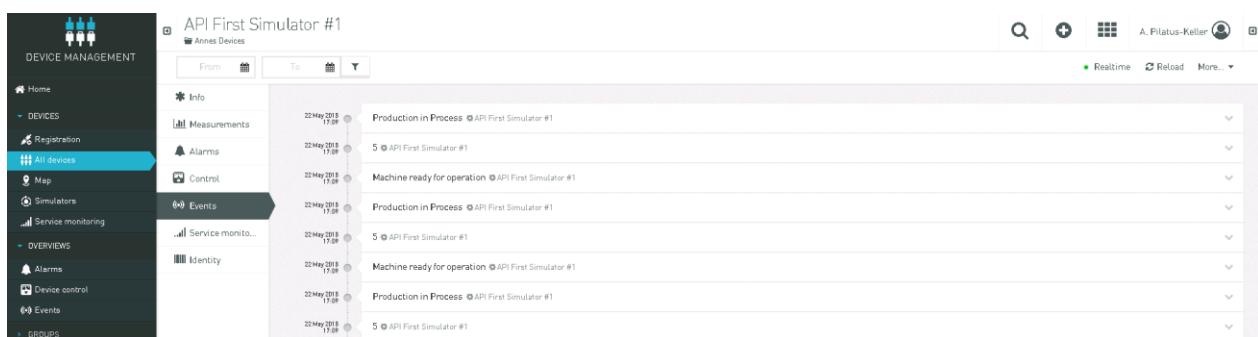

13. Select the simulator and navigate to **Measurements**. This will show the custom measurements.

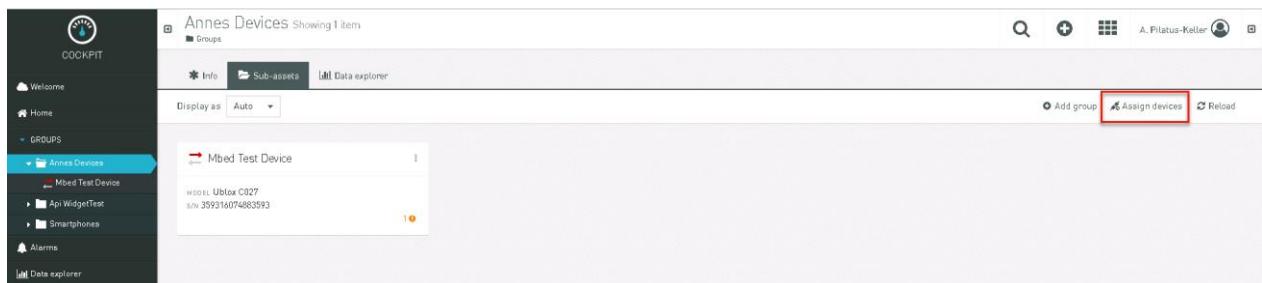

The graph which shows the values for the fragment PIECE_REMAINING shows both series: LEGNTH and TIME.

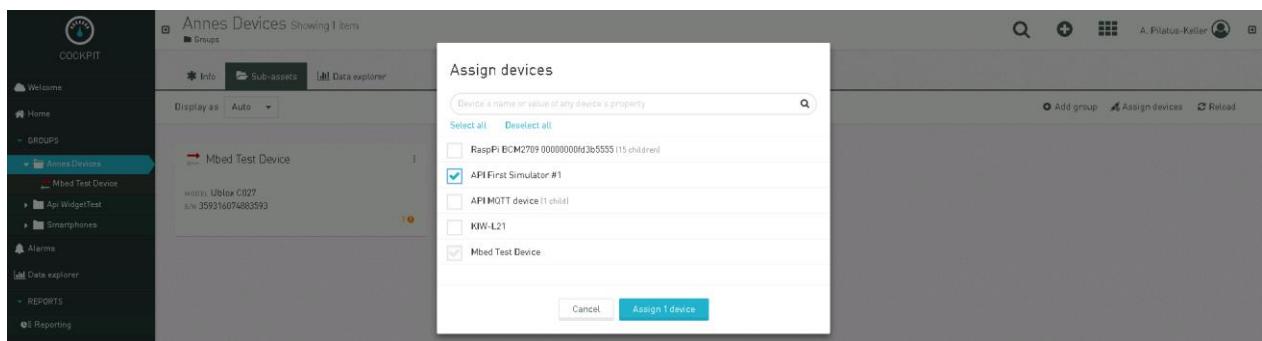

14. Navigate to **Events**. This will show the 3 events which you have added to the beginning of your playlist. The list shows the event based on time, the newest one at the beginning of the list.

15. Next you will use this simulated device as a normal device. Navigate to **Cockpit** and open one of your groups. Add the simulator to this group. Navigate to **Sub-assets** and click **Assign devices**.

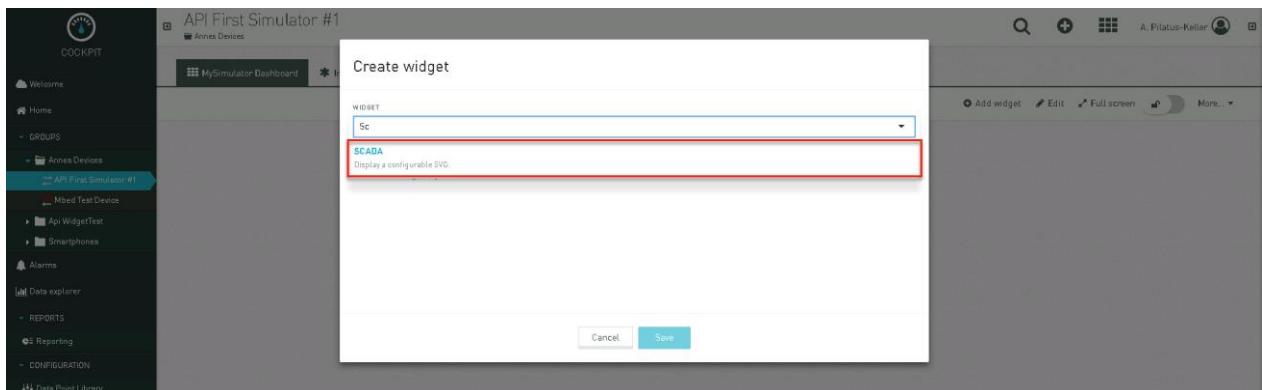

Select the simulator.

Click **Assign device**.

16. Select the simulator and create a new dashboard: **MySimulatorDashboard**.

17. Add a **SCADA** Widget to your device dashboard. A **SCADA** widget is a dashboard with animation.
Select your device dashboard. Click the **Add widget** button to add a widget. Search for **SCADA**

a. Provide the following properties:

- Title:** < Cumulocity login id > Scada
- Browse to the location **C:\Training\231-70E\Exercise8** where you find the file **windmill.svg**.
The instructor provides you with information where to find the file.
- Configure the 5 placeholders. You need to choose a device and map device information.
Hover the mouse over one of the placeholders. You will find the edit icon on the right hand side of the placeholder section. Click the edit icon.
